Catalan Based Questions

Q. Catalan Number

* Catalan numbers are sequence of natural numbers.

first few Catalan numbers for $n = 0, 1, 2, 3, 4$
are 1, 1, 2, 5, 14, ...

what?

Find n th Catalan Number.

How? For $n = 4$.

$dp \rightarrow$	1	1	2	5	14
Explanation:	0	1	2	3	4

~~dp[i]~~ is filled for any i as:

$$\text{for } i = 4, dp[4] = (1 * 5) + (1 * 2) + (2 * 1) + (5 * 1) \\ = 14.$$

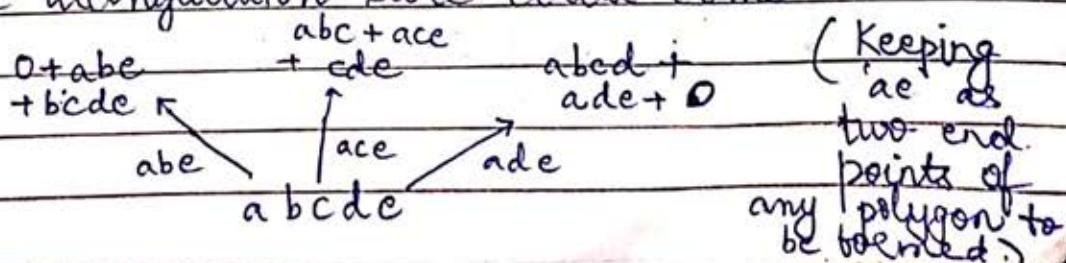

$$\text{or } C_0 C_3 + C_1 C_2 + C_2 C_1 + C_3 C_0$$

Q. Minimum Score Triangulation

What? Given N , which is a N -sided polygon with vertices labelled as given in the array, return the smallest possible total score that you can achieve with some triangulation of the polygon.

How?

For any given set of vertices, say $abcde$, a possible triangulation score could come as:

Relating to catalan, and matrix chain multiplication:

$$0 + abc + 0 \cdot \begin{matrix} 0+abd \\ +bcd \end{matrix} \begin{matrix} abc+acd \\ +0 \end{matrix}$$

$\overset{\uparrow}{abc}$ $\overset{\uparrow}{abd}$ $\overset{\uparrow}{bcd}$
 \underline{abc} \underline{abd} \underline{bcd}

ex: $N = 6$, arr = {1, 3, 2, 5, 4, 6}

$$a[0]*a[1]*a[2] = 1*3*2 = 6$$

0	1	2	3	4	5
0	0	0	6	16	36
1	0	0	0	30	64
2	0	0	0	0	40
3	0	0	0	0	120
4	0	0	0	0	0
5	0	0	0	0	0

answer

Min

$$\left[\begin{matrix} 0+6+30, \\ 6+10+0 \\ = 36, 16 \end{matrix} \right] = 16.$$

because a Δ has atleast 3 sides.

At gap 2, simply put ' $a[i] * a[i+1] * a[j]$ ',
else

$$dp[i][j] = \text{Math.min} [dp[i][j] , \\ a[i]*a[k]*a[j] + dp[k][j] + \\ dp[i][k]] .$$

($k = i+1$ to $j-1$)

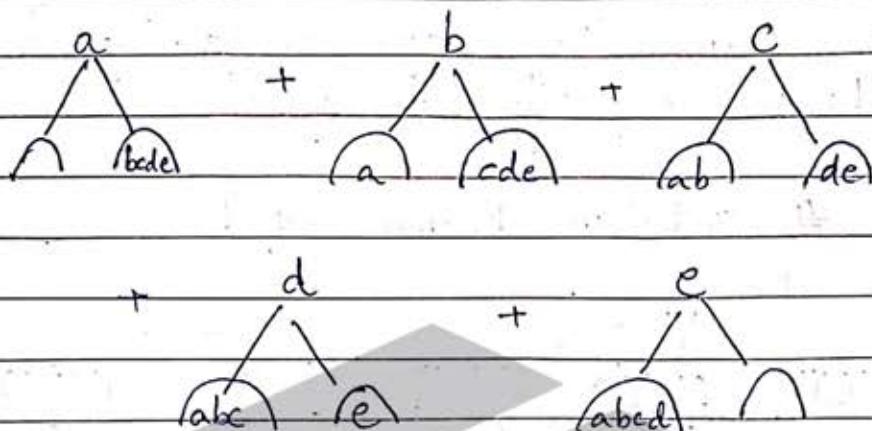

Q. Number of BSTs.

What?

Given n elements; tell how many BSTs can be formed?

s.t. $a < b < c < d < e$.

How? # Relate to Catalan Number.

$$0 \text{ elements} = C_0 = 1$$

$$1 \text{ element} = C_1 = 1$$

$$\text{Hence, } C_2 = 2,$$

$$\begin{aligned} C_3 &= C_0 C_2 + C_1 C_1 + C_2 C_0 \\ &= 1 \cdot 2 + 1 \cdot 1 + 2 \cdot 1 \\ &= 5 \end{aligned}$$

Q. Valleys and Mountains

What?

You are allowed 2 types of slashes, '/' & '\'. How many maximum shapes can you create, given none of the '/' or '\' can go below ground level (N will be given).

How? Ans is C_3 for '/' & '\'.

$$C_0 C_2 = 2$$

$$C_1 C_1 = 1$$

$$C_2 C_0 = 2$$

$\rightarrow N=3$

Catalan Number
of N .

Q: Paths to move from source to destination, given you can move only above diagonal.

Q. BracketsWhat?

Return number of ways containing n pairs of parenthesis correctly matched.

How? # Catalan Number of N

ex: $N=3$

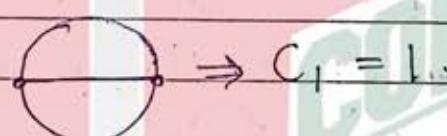

$$\begin{array}{ccccc}
 ((0)) & ()(00) & (0)(00) & ((0))0 & (0)(00)0 \\
 c_2 c_0 & c_0 c_2 & (c_0 c_2) & c_2 c_0 & c_2 c_0 \\
 & & & \downarrow & \\
 & & (c_0)(c_2) & & \\
 & & = c_0 c_2 & &
 \end{array}$$

Q. ChordsWhat?

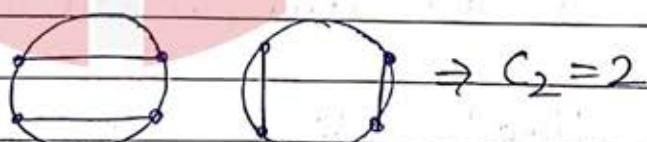

Given $2n$ points, tell how many non-overlapping (or non-intersecting) chords can be made?

How? # Catalan Number

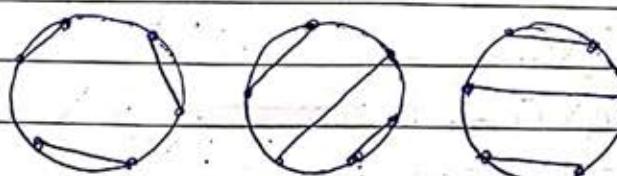

$$n=1, 2n=2$$

$$n=2, 2n=4$$

$$n=3, 2n=6$$

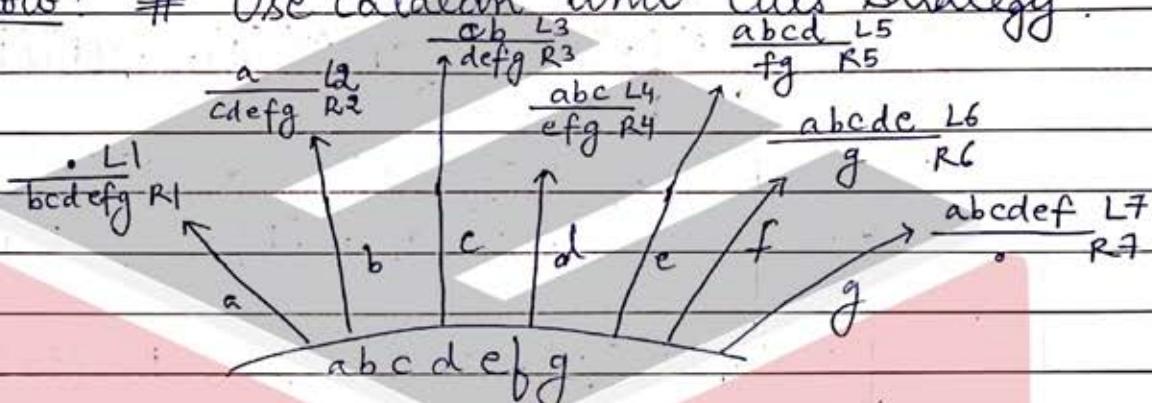

Q. Optimal BST

What?

Given sorted array keys of search keys and array frequency, construct a binary tree of all keys such that total cost of all the searches is as small as possible.

How? # Use Catalan and Cut Strategy.

$$\text{ans} = \min (L_1 + R_1, L_2 + R_2, L_3 + R_3 + L_4 + R_4, \\ L_5 + R_5, L_6 + R_6, L_7 + R_7) + \\ \text{sum of all frequencies (for } i \text{ to } j\text{)}.$$

For sums, you can use prefix sum array.

a	b	c	d	e	f	g	
a	fa						$\rightarrow \min(fa, fb)$
b	x	fb					$+ fa + fb$
c	x	x	fc				$\rightarrow \min(dp[b][c],$
d	x	x	x	fd			$dp[a][b])$
e	a	x	x	x	fe		$+ fa + fb + fc$
f	x	x	x	x	x	ff	$+ \min \text{ of all}$
g	x	x	x	x	x	x	$\text{other possible cuts.}$

$$\text{ex: keys} = \{10, 12, 20\}$$

$$\text{freq} = \{34, 8, 50\}$$

	0	1	2
0	34	50	142
1	0	8	66
2	0	0	50

for ($\text{gap} > 0$)

$$\text{dp}[i][j] = \min(\text{dp}[i+1][j], \text{dp}[i][j-1])$$

for ($k=i$ to $j-1$)

$$\text{dp}[i][j] = \min(\text{dp}[i][j],$$

$$\text{dp}[i][k] + \text{dp}[k+1][j])$$

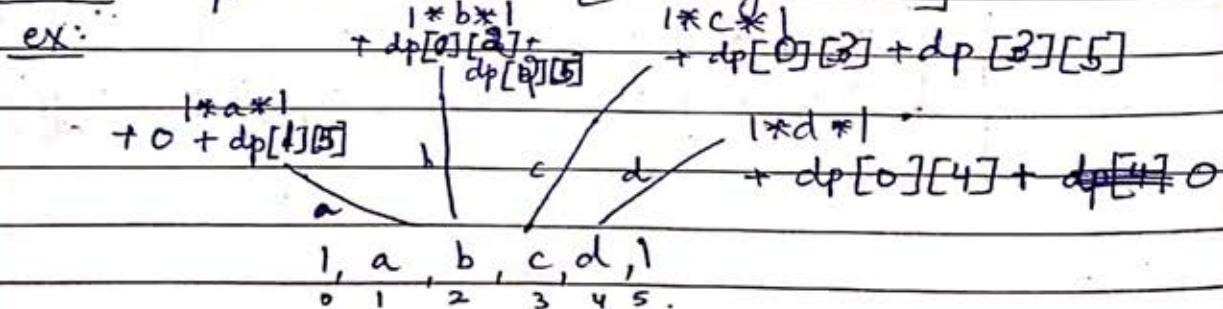

$$\text{dp}[i][j] += \text{psa}[j] - \text{psa}[i-1]$$

Q. Burst Balloons

What?

You are given n balloons, each having a number on it. You need to burst all balloons, s.t. On every burst you get $\text{nums}[\text{left}] * \text{nums}[\text{i}] * \text{nums}[\text{right}]$ coins. After burst, left & right become adjacent; burst in a way such that coins collected is maximised.

How? # like catalan [triangulation]

ex: [7, 1, 9, 12, 5, 6] \Rightarrow make dp of
 $n+2$ for
 1 at each end.

	0	1	2	3	4	5	6	7
0	0	0	7	126	103	1274	1725	1732
1	0	0	0	63	819	1239	1683	1725
2	0	0	0	0	108	585	1062	1071
3	0	0	0	0	0	540	1008	1062
4	0	0	0	0	0	0	360	432
5	0	0	0	0	0	0	0	30
6	0	0	0	0	0	0	0	0
7	0	0	0	0	0	0	0	0

$$\text{Ans} = \underline{\underline{1732}}$$

* We append 1, 1 in the two ends of array to make sure that 7, 6 which are the two ends of the original array are included in the burst process.

* At each i, j pair, we take the value of the burst as the max of all the possible bursts possible.

CUTS BASED QUESTIONS

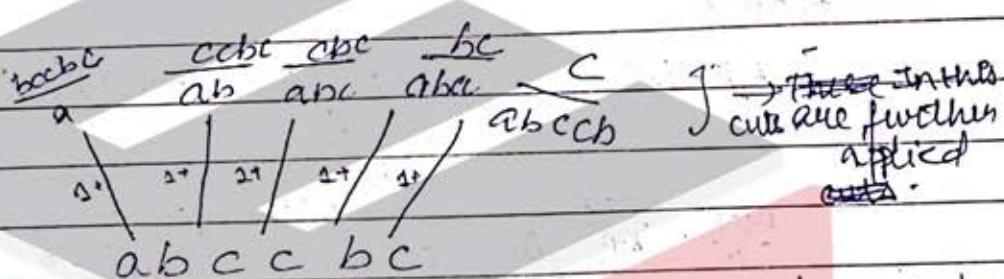

Q Minimum Palindromic cut

$O(n^3)$

what?

Find minimum no. of cuts required to make each part a palindrome.

How?

ans: a | bccb | c

e.g: abccb c

	a	b	c	c	b	c
a	0	1	2	2	0	2
b	0	0	1	1	0	1
c	0	0	0	0	1	1
c	0	0	0	0	1	0
b	0	0	0	0	0	1
c	0	0	0	0	0	0

→ h & b are equal
and cc is also
palindrome so 0
no. cuts.

gap=0 no cuts required

* move on gap strategy

* For every cut from all possible location p to q to get min const

gap=0 to n
 $i=0, j=gap+1$ to $j \leq n$

if ($\text{char}(i) = \text{char}(j)$ & $\text{dp}[i+1][j-1] = 0$)
 $\text{dp}[i][j] = 0$:

else $k=i$; $k < j$; $k++$

$\text{dp}[i][j] = \min(\text{dp}[i][k] + \text{dp}[k+1][j])$

$\text{dp}[i][j+1]$

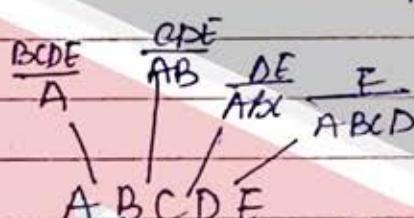

Matrix Chain Multiplication

What?

Given sequence of matrices find the most efficient way to multiply these matrices
find all order of multiplication and result is best (with less multiplication)

How?

$$ABCDE \rightarrow A \times (BCDE) \text{ or } (AB) \times (CDE) \text{ or } (ABC) \times (DE)$$

↓
BCDE multiplied in optimized way and then A multiplied to result.

$$\text{dimension} = [10 \underset{1}{\cancel{20}} \underset{2}{\cancel{30}} \underset{3}{\cancel{40}} \underset{4}{\cancel{50}} \underset{5}{\cancel{60}}]$$

A B C D E

Ans = 68000

	A	B	C	D	E
A	0 6000	18000	36000	68000	
B	0 0	24000	48000	88000	
C	0 0	0	60000	96000	
D	0 0	0	0	120000	
E	0 0	0	0	0	

$18000 + 1200 +$
 $\dim[ij] * \dim[iapj]$

$* \dim[apj]$

$\dim[ij] * \dim[j^o] * \dim[ij]$

no multiplication

Move in same strategy as matrix minimum palindromic cut

For ABCD $\rightarrow \min(A \times (BCD), (AB) \times (CD), (ABC) \times D)$

Q. Boolean Parenthesization

What?

Given a boolean expression with symbols 'T' & 'F' and operators filled b/w are &, |, ^.
^ . Count number of ways we can parenthesize the expression so that value of expression evaluates to true.

How?

eg: symbol = { T, F, T }
operator = { |, &, ^ }

→ Make a dp of pair class object

		True count (TC)		False count (FC)		All count (AC)		TIT	TITDF
		T	F	T	F	T	F	T	FAT
		T	F	T	F	T	F	T	T
		1	1	1	1	1	1	1	1
		1	1	1	1	1	1	1	1
		1	1	1	1	1	1	1	1
		1	1	1	1	1	1	1	1
		1	1	1	1	1	1	1	1
		1	1	1	1	1	1	1	1
		1	1	1	1	1	1	1	1

LPI → Left Pair I

RPI → Right Pair I

CTI(T & F) & possible options
(TIT) & F

TC = Addition of all TC of option
FC = Addition of all FC of option

For OR (|) \Rightarrow $TC = LP \cdot AC + RP \cdot AC - (LP \cdot FC + RP \cdot FC)$

$$FC = LP \cdot FC + RP \cdot FC$$

$$AC = TC + FC$$

For And (&) $TC = LP \cdot TC + RP \cdot TC$

$$FC = LP \cdot AC + RP \cdot AC - LP \cdot TC - RP \cdot TC$$

$$AC = TC + FC$$

For XOR (^) $TC = LP \cdot TC * RP \cdot FC + LP \cdot FC * RP \cdot TC$

$$FC = LP \cdot TC * RP \cdot TC + LP \cdot FC * RP \cdot FC$$

$$AC = TC + FC$$

Same cut strategy TC & FC is found on the basis of formula above.

Ans = 4

Here TC will be result

- Q Minimum And Maximum sum values.
with expression.. of $*^*$ & $+$.

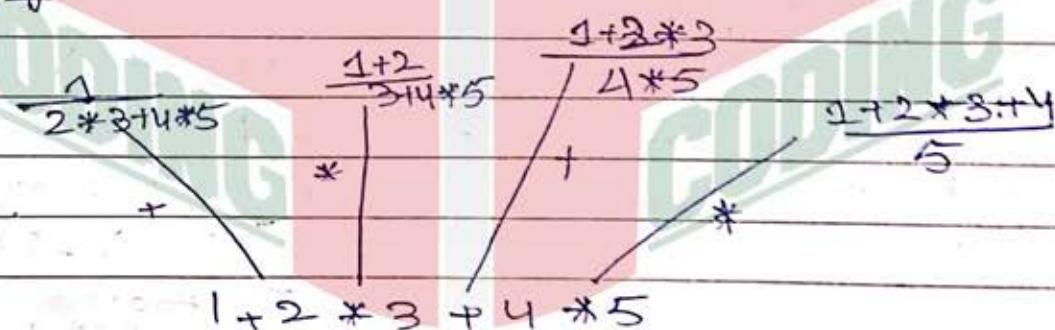

What?

Find minimum and maximum value that can be computed of a given expression

How?

- i) Make a dp of pair object
pair \rightarrow min \rightarrow max

eg: $1 + 2 * 3 + 4 * 5$

					$1 + (2 * 3) = 7$
					$(1+2)*3 = 9$
					$4 * 5 \text{ (operation b/w 2)}$
1	1	2	*	3	
+	1	3-1	3-3	7-9	
*	2	7	2-2	6-6	10-14
*	3	x	v	3-3	7-7 23-35
+	4	y	v	x	4-4 80-80
*	5	x	x	x	5-5

no itself is min max

8 Friends Pairing Problem

what?

Given n friends, each one can remain single or can be paired up. Each friend can be paired only once. Find total no. of ways in which they can be paired or remain single.

how?

eg: $n = 8$

x	1	2	4	10	26	76	232	764
0	1	2	3	4	5	6	7	8

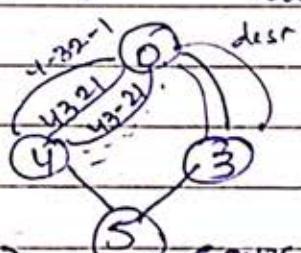

Ans = 764

$$dp[i] = dp[i-1] + dp[i-2] * (i-1)$$

↓
when current i^{th}
person is single
so it can make $dp[i-1]$
combinations.

↓
current element is paired
it can pair with $(i-1)$
people and remaining can
be arranged in $dp[i-2]$
ways.

*each box contains way to arrange
 i people.

$$\therefore f(n) = f(n-1) + f(n-2) * (n-1)$$

Q Number of ways to partition a set into K subsets

What?

A set has n elements, find number of ways to partition the set into K subsets.

How?

		$n=3$, $K=2$.			
		0	1	2	3
$K \downarrow$	0	0	0	0	0
	1	0	1	1	1
2	0	1	1	1	3

$dp[i][j] = dp[i-1][j] + dp[i-1][j-1]$

Ans = 3

$$f(n, k) = k * f(n-1, k) + f(n-1, k-1)$$

Note: when $i=1$ or $i=j$ value = 1

Because when $i=1$ only one set so can be divided in 1 way only and same goes when elements are equal to no. of subsets than (1 element in each set),

Each element has 2 choice

Form a new set

$$f(n-1, k-1)$$

↳ only this way.

Or part of other set

$$f(n-1, k) * k$$

↳ has k options

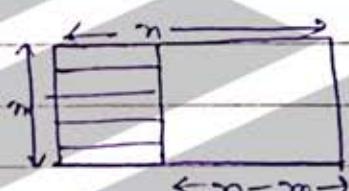

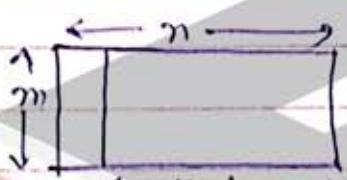

Q

Count the number of ways to tile floor

(chat)

A floor of size $n \times m$ needs to be tiled with tiles of size $1 \times m$. Count no. of ways to tile the given floor using $1 \times m$ tiles.
Tiles can be placed horizontally or vertically.

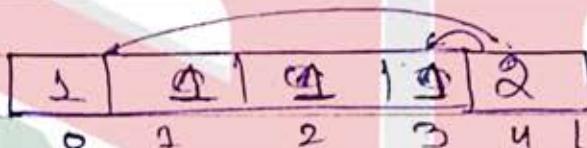

Flow2

vertical placement

$$f(n) = f(n-1) + f(n-m)$$

eq: $n=4$ $m=4$

place all horizontally

* $dP[i] = dP[i-1] + dP[i-m]$ for all vertically

Q

Coin Change

(I) Permutations

What?

Given a set of coins find all the arrangement (permutations) with sum of coins equal to target (Duplication allowed). Infinite supply of each coin.

How?

→ For each sum check for each and every coin.

coins	2	3	5	6	sum=7
dp:	1 0	1	1	1	3 3 5
	2.	3.	22.	2.3	6. 223.
				3.2	222. 232
				5.	33. 25
					322. 52

Ans = 5

For 7

$$7-2=5 \quad dp[5]=3 \Rightarrow 23.2, 32.2, 5.2.$$

$$7-3=4 \quad dp[4]=1 \Rightarrow 22.3$$

$$7-5=2 \quad dp[2]=1 \Rightarrow 2.5$$

$$7-6=1 \quad dp[1]=0 \Rightarrow \text{no combination}$$

Ans = 5

Why?

For each sum we are considering all options i.e why permutations are obtained

(II) Combinations

What?

Given a set of coins. find all selections that will give sum = target.

How?

for each coin update all the sums.

coins $\Rightarrow 2, 3, 5, 6$. sum = 7

	0	1	2	3	4	5	6	7
2	0	0	1	0	1	0	1	0

3	0	0	1	1	1	1	0	1	2	1
---	---	---	---	---	---	---	---	---	---	---

$$5-3=2 \quad \text{if } [1] + [1] = [2]$$

5	0	0	1	1	1	1	2	2	2
---	---	---	---	---	---	---	---	---	---

7	0	1	0	1	1	1	1	2	1	3	2
---	---	---	---	---	---	---	---	---	---	---	---

3 2 2.
5 2.

we are checking coins in sorted order hence we are not getting repeated combination ie we will never get 3 2 only 2 3 as 2 is checked before 3

RELATED QUESTIONS

Q. Unbounded Knapsack

What?

You are given a certain item weights and prices and a bag capacity find maximum profit you can make by using these items and filling the bag.

* Duplicacy of each item is allowed.
ie one item can be taken multiple times.

How?

Just like coin combination, always consider the maximum profit combination

eg:	weights	2	5	13	4			
	prices	15	14	10	45	30		
		0	1	2	3	4	5	6
2-10		0	10	20	30	40	50	60
3-45						111	1111	11111
4-30						1111	11111	111111
5-14								

2-15	0	10	20	30	40	50	60	70
3-45	0	10	20	45	55	65	90	100
4-30	0	10	20	45	55	65	90	100
5-14	0	10	20	45	55	65	90	100

For 3-45 at idx = 3 3-3 = 0 $dp[0] + dp[1]$
 $\max(45, 30) = \underline{45} = 45$

$idx=7 - \max(100, 70)$

$$\hookrightarrow 45 + dp[7-3] = 45 + 55 = 100$$

Q) Combination Sum Version 4

What?

Given an array of Integer and a target
find all possible permutations in which element
from array can amount to target

How?

Same as permutation of coinchange.
Here coins are elements of array.

Q) Linear Equation of N variables

What?

You are given a linear equation with N variables
find all possible values of these variables.

How?

$$\text{eg: } 2x + 2y + 3z = 4$$

Here coins are coefficients [2, 2, 3]
Sum = 4

- * Solve in same manner as combinations
of coin change.

box

3 len

o)

Target-Sum and Based Questions.

Q. Target-Sum

what?

Given an array, and a target; return if a subsequence exists whose sum of elements in subsequence equals target.

How? # Build a dp of $[n][target+1]$ where n is array length

For every box $\xrightarrow{\text{True if } dp[i-1][j] \text{ is True}}$ $\xrightarrow{\text{True if } dp[i-1][j - arr[i-1]] \text{ is True}}$

ex: $[2, 3, 1, 5, 6]$, Target = 10. True.

		Sum \rightarrow	0	1	2	3	4	5	6	7	8	9	10
		Arr \rightarrow	0	x	x	x	x	x	x	x	x	x	x
arr	i	0	x	x	x	x	x	x	x	x	x	x	x
		1	x	x	x	x	x	x	x	x	x	x	x
2	2	x	x	x	x	x	x	x	x	x	x	x	x
3	3	x	x	x	x	x	x	x	x	x	x	x	x
1	4	/	/	/	/	/	/	/	/	/	/	/	/
5	5	/	/	/	/	/	/	/	/	/	/	/	/
6	6	/	/	/	/	/	/	/	/	/	/	/	/

10 can
be made.

There are 2 sets which make 10.

1) $[3, 1, 6]$

2) $[2, 3, 5]$

* Reverse engineer to find paths-

* For negative numbers, make dp where columns range from $-\text{target}$ to target .

why? Every element either plays and checks if $\text{target} - (\text{its value})$ ~~can~~ can be made, or doesn't play if elements before it have already completed target.

Q. 0-1 Knapsack:

what?

You are given certain item weights and prices, and a bag capacity. Return maximum price you can make by using these weights and filling the bag completely / maximum total value.

* Each item either contributes completely, or doesn't contribute at all; duplicacy not allowed.

How?

ex: weights = [2, 5, 1, 3, 4] $\leq W = 7$
 prices = [15, 14, 10, 45, 30]

		0	1	2	3	4	5	6	7
		0	0	0	0	0	0	0	0
2-15	15	0	15	15	15	15	15	15	15
5-14	14	0	15	15	15	15	15	20	
1-10	10	10	15	25	25	25	25	29	
3-45	0	10	15	45	55	60	70	70	
4-30	0	10	15	45	55	60	70	75	

Max profit
= 75
[3, 4]

Like Target Sum, $dp[i][j] = \text{Math. max}$
 $(dp[i-1][j], dp[i-1][j - \cancel{\text{weights}[i]}])$

If profit made by elements except you was greater

If profit made by you + left over weight profit is greater

Q. Min partitions.
What?

Partition in a set into two subsets such that difference of subsets' sums is minimum. Return such minimum difference.

How?

1) First create a dp of the same type as is target sum like for $[n] \lceil (\text{target})/2 + 1 \rceil$. Here target = sum of all elements in array

2) After dp is filled,

$\left[\begin{array}{l} i = n/2 \text{ to } 0 \\ \text{if } (\text{dp}[n][i] == \text{true}) \\ \quad \text{if } (\text{sum} - \text{dp}[n][i] < \text{diff}) \\ \quad \quad \text{diff} = \text{abs}(\text{dp}[n][i] - \text{sum}); \\ \text{return diff.} \end{array} \right]$

boolean
array
just telling
if sum can
be made
or not.

If we check in last row only, for an index i , abs(value in dp - sum) gives min diff as answer.

Longest Palindromic Subsequence (LPS)

What?

Given a sequence of length n , find the length of longest palindromic subsequence.

How?

- 1) Make a dp of $n \times n$ where n is string length.
- 2) Each box of dp stores count of substrings (palindromic) from i to j where i is rows and j is col.
- 3) Move on gap strategy (ie diagonal by diagonal)
eg: $s = abckycbc$.

dp:

	a	b	c	K	y	c	b	c	ans.
a	1	1	1	1	1	3	5	5	
b	x	1	1	1	1	3	5	5	
c	x	x	1	1	1	3	3	3	
K	x	x	x	1	1	3	3	3	
y	x	x	x	x	1	1	3		
c	x	x	x	x	x	1	1	3	
b	x	x	x	x	x	x	1	1	
c	x	x	x	x	x	x	x	2	

Here this box represents string ckycb of length 5

String ckycb
length 5
Here is ckycb of 3 len

gap=0 to n

$i=0, j=gap+i$ to n

if $\text{char}(i) == \text{char}(j)$

$\text{strg}[i][j] = & + \text{strg}[i+1][j-1]$

else

$\text{strg}[i][j] = \max(\text{strg}[i+1][j-1], \text{strg}[i][j])$

why?

First and
last character
↓ ↓

for any string $S \Rightarrow \text{lps}(S) = \text{lps}(c_1 + r + c_2)$

4. combination can be possible:

- $\times \text{lps}(r) \times$
- $\times \text{lps}(r)c_2$
- $c_1 \text{lps}(r) \times$
- $c_1 \text{lps}(r)c_2$

→ when character c_1 & c_2 are equal whatever result $\text{lps}(\text{rest of the string})$ was given will be added 2.

→ when unequal possible solutions can be find

$$\text{in } c_1 + \text{lps}(r) = \text{strg}[i][j-1]$$

$$\rightarrow \text{lps}(r) + c_2 = \text{strg}[i][j]$$

max of these will be taken as we want max length.

Both cases
cover $\times \text{lps}$
case.

Q Minimum Number of deletions

what?

Find minimum no. of deletions required to make complete string a palindrome

How?

- 1) Find the length of longest palindromic subsequence using LPS.
- 2) Subtract LPS length from string length.

eg: $S = \underline{\text{a b c}} \underline{\text{k y c b c}}$
 $\text{lps}(S) = 5$

$$\text{min deletions} = 8 - 5 = \underline{\underline{3}}$$

Q.

Largest Common Subsequence

What?

Given two strings S and P find the longest common subsequence.

How?

- 1) Make a dp storage of size $N+1 \times M+1$ where N is size of string S & M is size of string P.

$$S = abcd \quad P = abed.$$

	a	b	e	d	x
a	3	2	1	1	0
b	2	2	1	1	0
c	1	1	1	1	0
d	1	1	1	1	0
x	0	0	0	0	0

If $c_1 \neq c_2$ are equal $\text{strg}[i][j] = 1 + \text{strg}[i+1][j+1]$
 true subsequences subsequence bcd & bed which is 2.

Alg:

$i = N \text{ to } 0$

$j = M \text{ to } 0$

$\text{char}(i) = \text{char}(j)$

$\text{strg}[i][j] = 1 + \text{strg}[i+1][j+1]$

else

$\text{strg}[i][j] = \max(\text{strg}[i+1][j], \text{strg}[i][j+1])$

here each box represents length of largest common subsequence from that subsequence formed by $(i \text{ to } n)$ & $(j \text{ to } m)$.

Q Count Palindromic Subsequence.

What?

Given a string of length N find all the pallindromic subsequences.

How?

- 1) Make a dp of size $N \times N$
- 2) Gap strategy is used to traverse

e.g. s: acbkca

	a	c	b	K	c	a
a	1	2	3	4	8	17
c	0	0	2	3	7	8
b	0	0	1	2	3	4
K	0	0	0	1	2	3
c	0	0	0	0	1	2
a	0	0	0	0	0	1

Ans = 17

Each character
itself is a palindrome

gap = 0 to n

$i=0, j=gap + i \leq n$,

if $\text{char}(i) = \text{char}(j)$

$\text{strg}[i][j] = \text{strg}[i][j-1] + \text{strg}[i+1][j-1] +$

$\text{strg}[i+1][j]$

else

$\text{strg}[i][j] = \text{strg}[i][j-1] + \text{strg}[i+1][j-1] - \text{strg}[i+1][j]$

* Each box contains count of substring (i, j) 's all pallindromic subsequence.

Q Count and longest Palindromic Substring.

What?

Given a string of length N find total no. of pallindromic substrings and also the largest pallindromic substring of that string.

How?

- Make a 2-D dp of $N \times N$ size
- Move on gap strategy:

eg: abcccbc

→ largest substring = bccb

	a	b	c	c	b	c	= bccb
a	T	F	F	F	F	F	
b	F	T	F	F	(T)	F	→ when i & j th char not equal sonot a Palindrome
c	F	F	T	T	F	F	
C	F	F	F	T	F	T	→ when characters i & j are equal check for inbetween string.
b	F	F	F	F	T	F	
c	F	F	F	F	F	T	→ longest substring is a palindrome

- update count for each True value.

- since we are travelling on gap last box to get true will be the largest substring. here bccb at gap 4.

Q Minimum no. of Insertions

what?

Count minimum no. of Insertions required to make whole string a palindrome.

How?

- Make a dp of $n \times n$ where n is length of string
- Every box contains no. of insertions for that substring a palindrome

eg: acbbcb

	a	c	b	b	c	b
a	0	1	2	2	1	2
c	x	0	1	-1	0	1
b	x	-1	0	0	1	1
b	-1	x	0	0	1	0
c	-1	x	x	x	0	1
b	-1	x	x	x	x	0

when i^{th} & j^{th} char
not equal
 $\min(i+1, j), (i, j-1)$

+1

when i^{th} & j^{th}
Character same
look diagonally
down.

1 length substring
palindrome so no
insertion.

Ans = 2

2 del + Insertions are required.

a^bc b b c b a

longest Increasing Subsequence

LIS

what?

Find length of longest increasing subsequence in a given array.

How?

Approach used : Dynamic Programming

Ex:

Original:	10	22	9	33	21	50	41	60	80	1
DP:	1	2	1	3	2	4	4	5	6	1
	10	10	9	10	10	10	10	10	10	1
	22	22	22	22	21	22	22	22	22	
				33		33	33	33	33	
					50		50	50	50	
						41		60	60	
							60		80	
								60		
									80	

↑ Answer.

why?

A box in the dp is defined as containing the maximum length LIS from starting(index 0) to the current position.

Each current element appends itself to the back of the maximum of all subarrays with largest element smaller to current element.

Complexity : $O(n^2)$ - Time
 $O(n)$ - space

Questions related to LIS.

Q. Maximum Sum Increasing Subsequence (MSIS)
what?

find maximum sum increasing subsequence in given array.

How?

Ex:

Original:	10	32	-90	55	21	-110	27	8	-5
DP:	10	42	-90	97	31	-110	58	8	-5
	10	10	-90	10	10	-110	10	8	-5

↑
answer = (97) : [10, 32, 55]

why?

Using same LIS technique, the box now contains the sum formed by maximum increasing subsequence from index 0 to current index.

Complexity : $O(n^2)$ - Time
 $O(n)$ - Space

Q. Longest Bitonic Subsequence

what?

Given an array, find the longest bitonic subsequence you can form, i.e., subsequence which first increases, then decreases.

How?

Find both LIS & LDS of the given array, ans is $\max(\text{lis}[i] + \text{lds}[i] - 1)$ at a given i .

ex:

lds:	3	3	2	3	2	3	2	2	2	1
arr:	10	22	9	33	21	50	41	60	80	1
lis:	1	2	1	3	2	4	4	5	6	1

max answer from here.

Longest bitonic subsequence = $4 + 3 - 1 = \underline{\underline{6}}$

10, 22, 33, 50, 41, 1.

* Related: Maximum Sum Bitonic Subsequence (MSIS)

Q. Minimum number of deletions to make sorted sequence.

What?

Return number of deletions to be done to make given sequence sorted.

How?

Step 1. find lis.

Step 2. Return n (array length) - lis (length).ex:

lis:	1	1	2	2	3	3	4
------	---	---	---	---	---	---	---

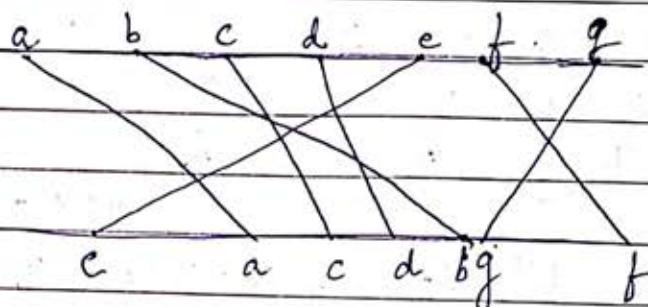

\therefore #Deletions = $6 - 4 = \underline{\underline{2}} (7, 5)$

Q. Maximum non-overlapping bridges.

What?

Given the starting and ending of bridges, return the maximum no. of non-overlapping bridges that can be constructed.

How?

Step 1: Sort on starting points

Step 2: LIS on end points.

e	a	c	d	b	g	f
1	1	2	3	2	4	4
e	a	a	a	a	a	a
c	c	c	c	b	c	c
d	d	d	d	d	d	d

∴ Maximum 4 bridges can be constructed

Q. Russian Doll Envelopes.
what?

Return maximum number of envelopes that can fit into another much like a Russian doll

How?

Step 1: Sort on widths.

Step 2: LIS on heights.

Given:	widths:	2	1	7	10	8
	heights:	9	4	1	7	3

	a	b	c	d	e	
After sorting:	1	2	7	8	10	
	4	9	1	3	7	⇒ = 3
LIS →	1	2	1	2	2	
	a	a, b	c	c, d	c, d, e	

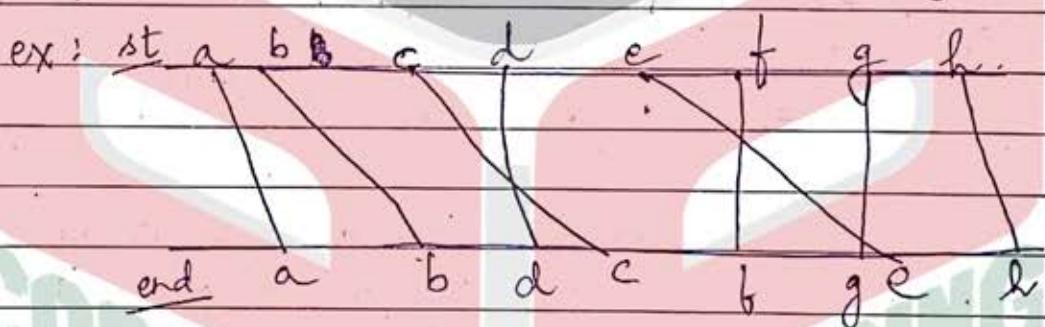

Q. Activity Selection — Greedy (like LIS).

Given starting and ending times of various activities, return maximum number of activities that can be done by a person in a party.

How? → very similar to bridges, optimised by using greedy approach.

Step 1. Sort on end points.

Step 2. Include first activity always, then include subsequent activities if end of previous was before starting of current.

end:	a	b	c	d	e	f	g	h
ends sorted:	a	b	d	c	f	g	e	h
	1	X	2	X	3	4	X	5
	✓	b.st	✓		✓	✓		✓

a.et

st: start time, et: end time.

→ 5 activities a, d, f, g, h can be done.

Q. Arithmetic-Slices I

What?

Return the number of arithmetic slices in an array, slice is a sequence of atleast 3 numbers and has same difference between consecutive numbers. (Subarrays as slices.)

How? → Very much like lis, just check if you have same difference with your previous element.

ex:	2	4	6	8	10	-2	3	7	11	15	0	12	3
ans →	0	0	1	2	3	0	0	0	1	2	0	0	1
(dp)	2,4,6	2,4,6,8	2,4,6,8,10	4,6,8	4,6,8,10		3,7,11	3,7,11,15	7,11,15		0,1,2	0,1,2,3	1,2,3

atleast
3 length
for a slice.

$$\begin{aligned}
 \text{Ans} &= \text{sum of ans array} \\
 &= 1 + 2 + 3 + 1 + 2 + 1 + 2 \\
 &= 12
 \end{aligned}$$

- # $\text{dp}[i] = \text{dp}[i+1] + 1$ if it makes a slice.
- # Notice that each subarray is an AP.

Q. Arithmetic-Slices - II

What?

Find all arithmetic slices such that they are of atleast 3 length and can be any subsequences of the given array where each element has same difference with its consecutive.

How?

Maintain a HashMap for each element where key is gap and value is count of elements with this gap prior to the current element.

ex:

2	-2	4	0	6	8	10	-1	3	6	7	8	10
-4=1	6=1	-4=1	6=1	2=3	2=4	-11=1	4=1	3=2	1=2	1=3	2=7	
2=1	2=1	2=1	2=2	8=1	4=9	-9=1	-7=1	7=1	4=2	2=5	3=2	
2=1	-2=1	8=1	4=1	10=1	-7=1	-5=1	-4=1	8=1	5=2	4=4		
		4=1	10=1	6=2	-1=1	-3=1	-2=1	-3=1	9=1	7=1		
				12=1	-5=1	3=1	0=1	-1=1	-2=1	11=1		
				8=1	-3=1	-1=1	6=1	7=1	0=1	0=1		
						5=1	2=2	3=1	8=1	8=1		
						8=1	8=1	9=1	4=1	0=1		
						1=1	4=1	5=1	10=1	6=2		
									6=1	12=1		

$$\begin{aligned}
 & 1 + 2 + 3 + 1 + 1 + 1 \\
 & (2,4,6) \left(\begin{matrix} 2,4,6,8 \\ 4,6,8 \end{matrix} \right) \left(\begin{matrix} 2,4,6,8,10 \\ 4,6,8,10 \\ 6,8,10 \end{matrix} \right) \left(\begin{matrix} 2,6,10 \\ 0,3,6 \end{matrix} \right) \left(\begin{matrix} 2,4,6 \\ 2,4,6 \end{matrix} \right) \\
 & + 1 + 2 + 6 + 1 + 1 \\
 & (-1,3,7) \left(\begin{matrix} 2,4,6,8 \\ 4,6,8 \end{matrix} \right) \left(\begin{matrix} 2,4,6,8,10 \\ 4,6,8,10 \\ 6,8,10 \end{matrix} \right) \left(\begin{matrix} 2,4,6,8,10 \\ 4,6,8,10 \\ 6,8,10 \end{matrix} \right) \left(\begin{matrix} 4,7,10 \\ 2,6,10 \end{matrix} \right) \\
 & + 9 + 1 + 2 \\
 & (6,7,8) \left(\begin{matrix} 2,4,6,8 \\ 4,6,8 \end{matrix} \right) \left(\begin{matrix} 2,4,6,8,10 \\ 4,6,8,10 \\ 6,8,10 \end{matrix} \right) \left(\begin{matrix} 2,4,6,8,10 \\ 4,6,8,10 \\ 6,8,10 \end{matrix} \right) \left(\begin{matrix} 2,4,6,8 \\ 4,6,8 \end{matrix} \right) \\
 & + 1 + 1 + 3 \\
 & (2,6,10) \left(\begin{matrix} 2,4,6,8,10 \\ 4,6,8,10 \\ 6,8,10 \end{matrix} \right)
 \end{aligned}$$

* For each element, it calculates gap with all previous elements, and adds in its hashmap gap vs count+1 where count is the count stored for the same gap in the element seen.

- * If no count for same gap found, add gap vs 1 in current hashmap.
- * If more than 2 previous elements have same gap with the current element, add the counts in the gap vs count 1 which was already stored.
- * For each element, ans += count obtained from previous maps (if > 1).

Q. Word Break
what?

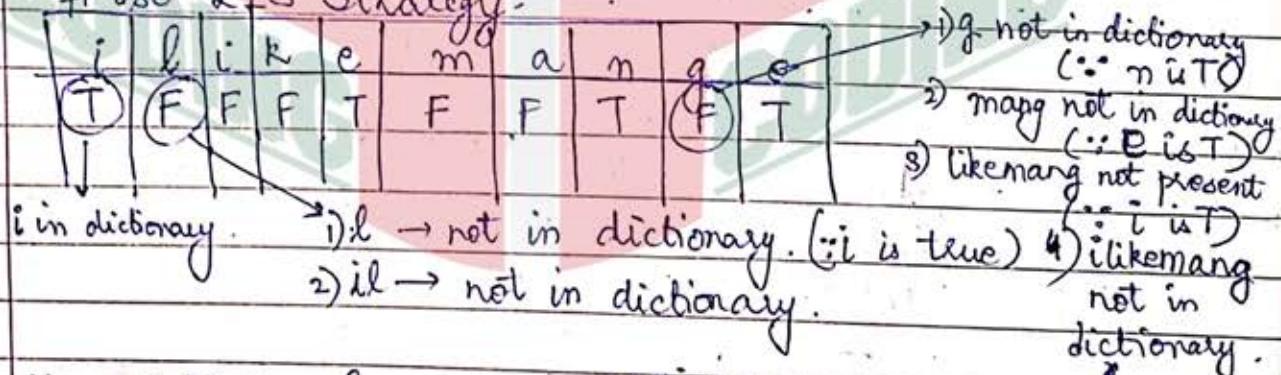

Given a string and a dictionary (list of strings), tell if it is possible to make a sentence from string.

How?

ex: string : ilikemango

dictionary : { sung, man, go, like, i, am, mango, samsung }.

Use LIS strategy.

variations: how many ^{maximum} words & sentences can be formed?

- * In T/F case, we check for all the words that could be present in dictionary where previous word (till T) is seen in dp array, and from that index +1 to current index, substring is checked.

for ex: for \boxed{n}

i like \rightarrow e was true, so we checked 'man'
T F F F T
in dictionary & found it -

In count words, we would, in this case, increase word count by 1 -

For words & sentences :

ex: s: i like mango samsung.

d: { i, man, go, sam, like, sung,
mango, samsung } $\xrightarrow{\text{m was made in 2 ways}}$
 $\xrightarrow{\text{go was end word}}$ $\xrightarrow{\text{sam was a word}}$ $\xrightarrow{\text{g was end word}}$

i	l	i	k	e	m	a	n	g	o	s	a	m	s	u	n	g	
sentence:	1	0	0	0	1	0	0	1	0	2	0	0	2	0	0	0	4
words:	1	0	0	0	9	0	1	0	3	0	4	0	0	5	0	0	6

For g: 4 sentences are:

i - like - man - go - sam - sung

i - like - mango - sam - sung

i - like - man - go - samsung

i - like - mango - samsung.

g \rightarrow m ('like mango sam' was already made in 2 ways, & sung was

('like mango' was already made in dictionary, $\therefore +2$ sentences). - ①

made in 2 ways, & samsung was in dictionary
 $\therefore +2$ sentences). - ②

$$\begin{aligned} \Rightarrow g &= ① + ② \\ &= +2 + 2 \\ &= +4 \end{aligned}$$

Q. Maximum sum alternating subsequence.
What?

Given an array, find longest M.S.A such that it is of the type increasing-decreasing-increasing

How?

We use LIS strategy and create dp array from end; # also uses include-exclude.

4	3	8	5	3	8
6	1	2	3	4	5

lengths (sums)	4	4	4	2	2	1	1
	4-8-5-8	3-8-5-8	4-(8)	2(5-8)	2(3-8)	>(8)	1
	5	1-(3)	2(8-5-8)	3(5-3-8)	1-(3)	>(8)	1, 1

Ans: 5 length subsequence
 $\Rightarrow (4 - 3 - 8 - 5 - 8)$

$$\text{Sum} = 28$$

* At every i th box, for $j = i+1$ to end, if increasing sequence is to be found, use decreasing boxes and vice versa.

* Since start is always, answer will always be in decreasing dp[0].

Q. Highway Billboard Problem

What?

Given highway of M miles, task is to place billboards in such a way that revenue is maximized; with a restriction that no two billboards can be placed within t miles or less than it.

How?

$$\text{ex: } M = 20$$

$$X = \{6, 7, 12, 13, 14\} \rightarrow \text{billboards}$$

$$R = \{5, 6, 15, 3, 1\} \rightarrow \text{revenue}$$

- 1) If $N^2 > M$, use Miles method, else LIS.
- 2) $n \log n$ approach using TreeSet

- 1) When $N^2 < M$

6-5	7-6	12-5	13-3	14-1
5	6	(10)	9	7

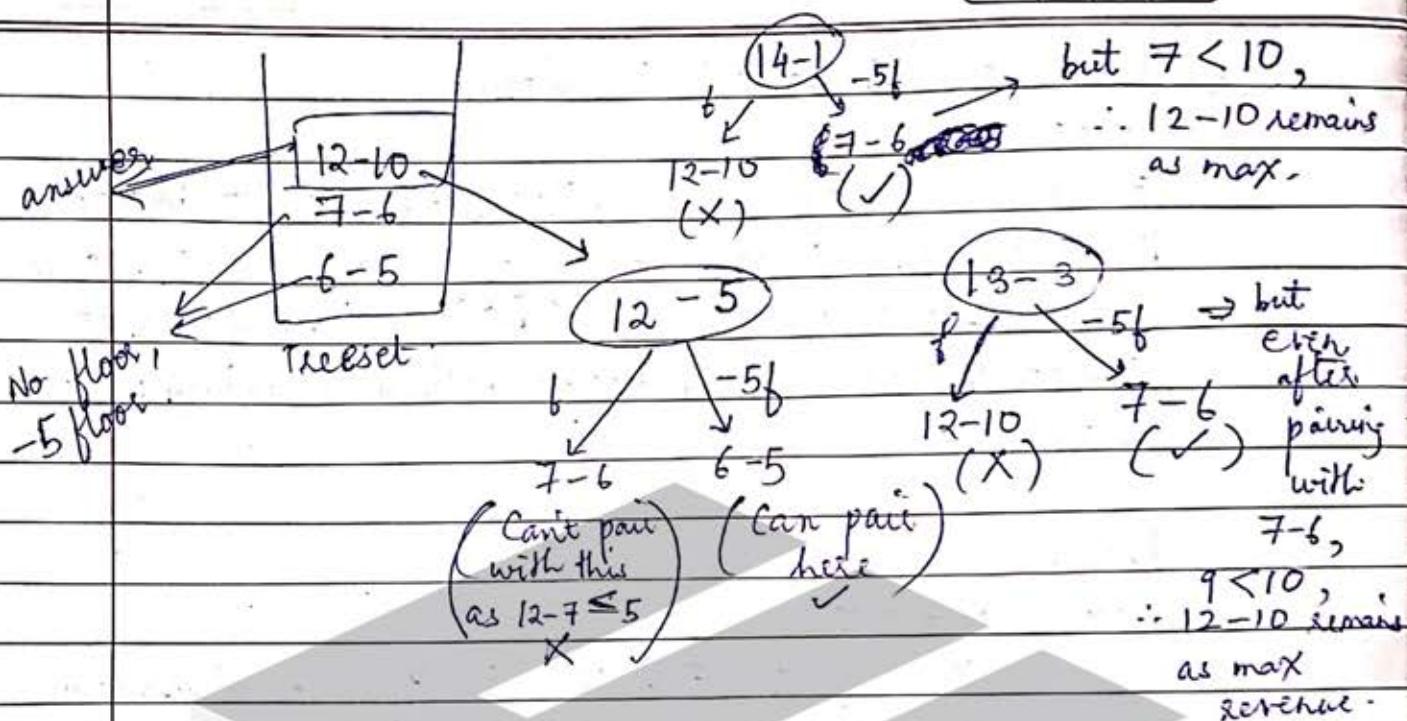

max. value = ans = 10.

- 2) When $N^2 > M$.

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
0	0	0	0	0	5	6	6	6	6	10	10	10	10	10	10	10	10	10	(10)

ans = dp[M] = 10

- 3) Use TreeSet, for each pair, if its floor and $-t$ floor does not exist, push pair, else let it have maximum profit.

Q. Word wrap problem.

what?

Given a sequence of words, and limit on characters in one line (line width), put line breaks in given sequence such that lines are printed in a way to minimize score.

Score = (sum of all lines where one line cost = (No. of extra spaces in the line at the end) 3).

Don't include last line's score.

How? You can use two strategies, either LIS from left or LIS from right.

For sum of scores, use a prefix sum array / 2D dp.

For a word, gap is calculated as:

ex: geeks = 5 length, max length = 15.

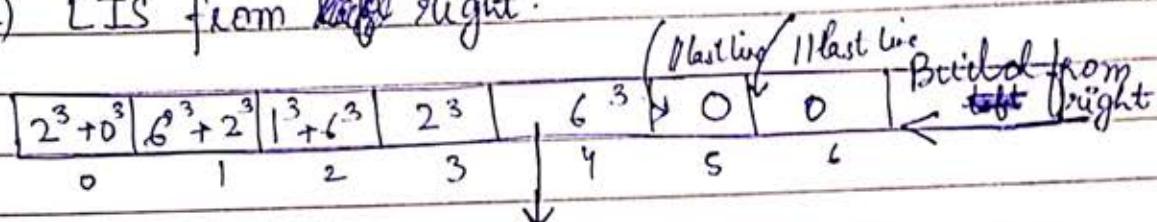

$$\therefore \text{gap in a line having "geeks"} = (15-5)^3 \\ = 10^3$$

Geeks for geeks presents word wrap problem.

lengths:

5	3	5	8	4	4	7
---	---	---	---	---	---	---

I) LIS from left right.

$$dp[0] = \underline{\underline{8}} \Rightarrow \text{ans.}$$

Ans:
L1 → geeks for geeks.
L2 → presents word
L3 → wrap problem

$$\text{I) } 4 \rightarrow L1 \quad (15-4) = 11^3$$

$$5, 6 \rightarrow L2 \quad 0^3$$

$$\text{II) } 4, 5 \rightarrow L1 \quad (15-9) = \boxed{6^3} \quad \checkmark$$

$4 \rightarrow L2 \quad 0^3$ mind all lines.

III) $4, 5, 6 \rightarrow \text{cannot come in one line.}$

II) example for LIS from left. $M=6$

1	2	3
a a a	b b b	c c c
3	2	2

Ans: $\boxed{3^3 \quad 0^3 \quad 3^3 + 1^3 \quad (3^3 + 1^3)} \Rightarrow dp[3] = 9 + 1 = \underline{\underline{10}}$

Ans:

L1 → a a a
L2 → b b b c c
L3 → d d d d d

INCLUDE EXCLUDE STRATEGY BASED QUESTIONS.

Q Count of Binary strings with no consecutive zeroes.

What?

Count the no. of binary strings that can be formed of size n such that no zero appear consecutively.

How?

	1	2	3	4	5	6	7	$n=7$
eg: 0	1	2	1	2	3	5	8	13
1	1	1	9	3	5	8	13	21

↓ 3+5

← zeroes ← ones

$$\text{Ans} = 13 + 21 = \underline{\underline{34}}$$

\rightarrow represents strings ending with zero's

\rightarrow represents strings ending with 1's

for any length x

string ending with zero \rightarrow count of string of length $(x-1)$ ending with 1.

(new z)

$n_z = \text{Ones.}$

\therefore (no 2 zero can come together)

For any length x string ending at 1

$\therefore n_0 = \bullet \text{One's} + \text{zero's}$

as one can be appended

to both.

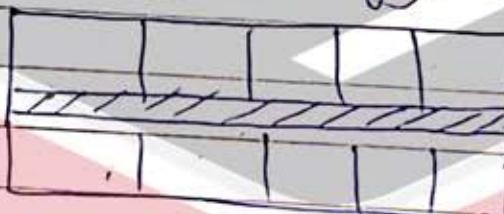

Q Building space Building

What?

We are given no. of sections and each section has 2 plots on either sides of the road. Find all ways to construct building such that no two building are together.

How?

Apply the same strategy of Include & Exclude.

sections = 5

- (1's) Space → represent if ~~previous~~ current spot ~~is~~ is a space.
 - (0's) building → ways in which ~~✓~~ that spot is a building
(Inprov strategy)
- building can be arranged such

	1	2	3	4	5	
(0's) build	1	1	9	3	5	713
(1's) build	2	8	3	5	8	→ this will give arrangement for one side of road.
sp						

Same arrangement can be done on other side of road.

$$\Rightarrow \text{Ans} = \underline{2 * 13}$$

- ① Find arrangement for one side using Include and exclude considering spaces 1's building as 0's
- ② Twice the no for answer.

Q Maximum sum subsequence without Adjacent

What?

Find the maximum sum subsequence such that no two adjacent element come in same subsequence.

How?

eg:

	5	6	10	100	106		prev-excl + current value.
Inc.	5	6	15	106	25	112	
Exc	0	5	6	15	106	25	Ans = 112 ↓ prev Inc.

Inc: Means if cur element is included (so prev Excluded sum is added to it)

Exc: It Means that cur element is Excluded (so prev Include is the current Exclude)

Q

Paint House

What?

Given n no. of houses each can be painted with 3 different colours red, blue & green.

cost of painting each house is given. You need to find minimum amount to spend painting all the houses such that no 2 adjacent house have same color.

How?

\Rightarrow It represents in how many ways previous house can be colored such that current house is colored red.

similarly for 'g' and 'b'

Eg: R G B.

	R	G	B
H1	1	5	7
H2	5	8	4
H3	3	2	9
H4	1	2	4

$$\text{new } r = \min(g, b) + \text{cost (red) at } i$$

$$\text{new } g = \min(r, b)$$

+ cost of green at H_i

$$\text{new } b = \min(r, g)$$

+ cost of blue at H_i

	H1	H2	H3	H4	Ans
r	1	10	8	8	
g	5	9	7	10	
b	7	5	18	11	

$$\text{Ans} = \min(r, g, b) \Rightarrow 8.$$

* we are taking minimum of other colors because only these combinations will be valid.

8 Paint House Version 2

What?

Given n houses that can be painted from k different colors. Paint house such that no two adjacent houses have same color. Cost of painting each house with each color is given.

How!

for eg:

	H1	H2	H3	-1 Hn
color1	c_1	$\min(c_2 - c_k) + c_1$		
color2	c_2	$\min(c_1, c_3 - c_k)$		
color3	c_3	$\vdots + c_2$		
\vdots	\vdots	\vdots		
colorK	c_k	$\min(c_1 - c_{k-1}) + c_k$		

① For House 1

cost will be same as given costs

② For house 1 to n

Find minimum from prev cost of all other colors and add to current cost

For House i & color j
 $\text{cost} = \min(\text{cost of all colors 0 to } j-1) + \text{cost of all colors } j+1 \text{ to } k$
 $+ \text{cost}[i][j])$

Note: To find minimum keep track of smallest and second smallest of all previous cost.

If min smallest cost is from same color then choose second smallest cost and add curr cost otherwise add smallest cost.

Q Paint Fence

what?

Given a n post fence. find the cost to paint it with k colors such that not more than 2 adjacent posts has same color.

how?

eg: $n=8, k=3$

	1	2	3	4	5	6	7	8
S	0	3	6	18	48	132	360	984
D	3	6	18	48	132	360	984	2688

S: combinations such that current color and previous color is kept same

D: combinations such that current color and prev color is kept different

$$\text{Ans} = 984 + 2688 = \underline{\underline{3672}}$$

current same (S) = prev Different (D)

because

$$x_1 \Rightarrow -x_1 x_1$$

$$x_2 \Rightarrow -\underline{x_2} x_2$$

$$\underline{x_3} = -\underline{x_3} x_3$$

x_1, x_2, x_3 are colors

Dcombination

current Different (D) = (prev same^(S) + prev Diff^(D)) * (k-1)

each combination ending with color X has (k-1) color options to make last 2 different.

Q Count substrings of nature $a^+b^+c^+$ in a given string

what?

Count all the substring of a given string which are in form $a^+b^+c^+$ where '+' represents one or more occurrence of that character.

How?

e.g. s = abcabc.

	a	b	c	a	b	c
countA	1	1	1	3	3	3
countB	0	1	2	1	5	5
countC	0	0	2	1	1	7

ans

$$\text{countA} = 2 * (\text{countA}) + 1$$

$$\text{countB} = 2 * (\text{countB}) + \text{countA}$$

$$\text{countC} = 2 * (\text{countC}) + \text{countB}$$

↓ ↓
Previous

why?

	a	b	c	a	b	c
a	1 ^a	1 ^a	1 ^a	3 ^{a'aa}	3 ^{a'aa}	3 ^{a'aa}
b	0	1 ^{ab}	1 ^{ab}	1 ^{ab}	5 ^{abb', ab}	5 ^{ab, a'b, ab'}
c	0	0	1 ^{abc}	1 ^{abc}	1 ^{abc}	7 ^{a'b'c', abc', a'b'c', abb'c, abc', abc', ab'c}

For count c. we are adding $2 * \text{count}(c)$ because we can make all the combination made by old c with new c (c') and $\text{count}(B)$ is added as c' can be appended at the end of those strings to make them of $a^kb^lc^m$ type.
Similarly with $\text{count}(A) + \text{count}(B)$.

Some other Related Questions

- Q Buy and sell stocks with only K transaction allowed.
- Q Buy and sell stocks with ~~only~~ cooldown time
- Q Buy and sell stock with transaction fee.

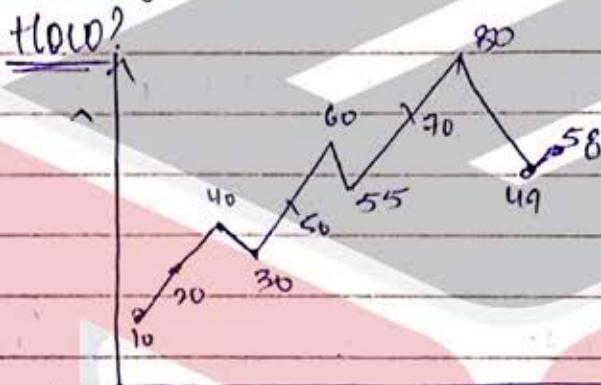

Buy and Sell Stocks (6 variations)

1) With Infinite transactions

What?

Find the maximum profit that can be earned when infinite transactions can be done.
only buys allowed buy & buy should not overlap

How?

when

$\text{arr}[i+1] > \text{arr}[i]$

then buy.

profit = $\text{arr}[i] - \text{arr}[i+1]$

$$(20-10) + (40-20) + (50-30) + (60-50) + (70-55) + (80-70) + (58-49)$$

$$= 94$$

2) with only 1 transaction

What?

Find the maximum profit that can be earned when only 1 transaction is allowed.

How?

e.g. 2 5 9 10 7 8 15 3 6 12

minElement	2	2	2	2	2	2	2	2	2
------------	---	---	---	---	---	---	---	---	---

curr profit	2	3	7	8	5	6	13	1	4	10
-------------	---	---	---	---	---	---	----	---	---	----

max profit	0	3	7	8	8	8	13	13	13	13
------------	---	---	---	---	---	---	----	----	----	----

\downarrow
 $\text{currElement} - \text{minElement}$

Since only 1 transaction is allowed we find min price at which we can buy and calculate profit.

$\text{mind} = \min(\text{minel}, \text{current element})$

$\text{curr profit} = \text{current element} - \text{min element}$

3) Atmost 2 transaction allowed.

what?

Calculate maximum profit when atmost 2 transactions can be done.

How?

2 dp's will be built first containing profits calculated with min and other containing profits with max.

eg: $8 | 6 | 4 | 7 | 11 | 15 | 10 | 6 | 3 | 5 | 7 | 10 | 11 | 18 | 12$

$\begin{matrix} \text{min} & 8 & 6 & 4 & 4 & 4 & 4 & 4 & 3 & 3 & 3 & 3 & 3 & 3 \\ \text{max profit from left} & 0 & 0 & 0 & 3 & 7 & 11 & 11 & 11 & 11 & 11 & 11 & 11 & 15 & 15 \end{matrix}$

$\begin{matrix} \text{max profit from right} & 15 & 15 & 15 & 15 & 15 & 15 & 15 & 15 & 13 & 11 & 8 & 7 & 0 & 0 \\ 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 18 & 12 \end{matrix}$

$$\text{Ans} = \max[\text{left}[i] + \text{right}[i]] = 26 \quad \leftarrow L_{\max}$$

→ max profit from left indicates maximum profit earned ~~at~~ when selling on that box or before.

→ max profit from right indicates when ~~pref~~ selling and buying at current box.

④ Buy and Sell stocks with K transaction

What?

Maximum profit that can be earned doing atmost K transactions.

How?

→ Make a 2d-DP that maps all n elements on column & K on rows ie $(K+1 \times n)$ size.

eg: [9 | 2 | 3 | 7 | 8 | 3 | 10 | 11] \Rightarrow prefix.
 $K=3$

i	0	0	0	0	0	0	0	0
1	0	0	1	5	6	6	8	9
2	0	0	1	5	6	6	13	14
3	0	0	1	5	6	6	13	14

$$\text{strg}[i][j] = \max(\text{strg}[i-1][x] + \text{price}[j] - \text{pre}[x])$$

Ans=14

here every box represents maximum profit if i transaction allowed.

where x is from 0 to j-1

$$\text{Also } \text{strg}[i][j] = \max(\text{strg}[i][j-1], \text{strg}[i-1][j])$$

→ To perform current transaction \Rightarrow maximum of all profits earned in previous transaction is taken and cost (profit) from current transaction is added.

→ we also check previous value is same now because maybe profit earned from that is more than current.

Note: when k is greater than $n/2$
 use infinite transaction (recursion) method
 because to earn profit from n prices maximum transaction needed are $n/2$.

(5) with cooldown Period.

What?

Find the maximum profit that can be earned when 1 day cooldown is required after every transaction (sell)

How?

This is done by include & exclude strategy.

e.g: [9 | 1 | 3 | 10 | 1 | 4 | 8 | 6]

	9	1	3	10	1	4	8	6
buy	-9	-1	-1	-1	1	5	5	5
sell	0	0	2	9	9	9	13	13
cool	0	0	6	2	9	9	9	13

↑ max(2, 10-1) = 9

more of these = 13

Buy → Maximum profit when bought at current price
 Sell → Maximum profit when sold at current price
 cooldown → Maximum profit when at this price cooldown is done!

$$\text{Buy} = \max(\text{cool-price (curr)}, \text{buy})$$

$$\text{sell} = \max(\text{sell}, \text{price (curr)} + \text{buy})$$

$$\text{cool} = \max(\text{sell}, \text{cool})$$

⑥ With transaction fees

what?

Maximum profit that can be earned when transaction fees is applied on each transaction

How?

Include Exclude strategy is used.

eg:	9	1	3	10	1	4	6	9	Fee = 2
buy	-1	-1	-1	-1	6	6	6	6	Ans = 13
sell	0	0	0	7	7	8	10	13	(8, 6+6-2)

$$\text{sell} = \max(\text{sell}, \text{price} + \text{buy}) - \text{transaction fee}$$

$$\text{buy} = \max(\text{buy}, \text{sell} - \text{price})$$

Costs Paths

RELATED QUESTIONS

Q Min Cost Path

what?

Given a 2-D board find the minimum cost required to reach from starting position $(0,0)$ to ending pos $(N-1, M-1)$ where board dimensions are $N \times M$. 2 possible moves are Horizontal (1 step) & vertical (2 step)

How?

1) Make a dp storage of dimension $N \times M$

	0	1	2	3	4
0	5	2	8	1	7
1	0	5	0	4	3
2	3	1	2	8	6
3	6	0	7	0	8
4	1	2	4	9	5

$i = N-1 \text{ to } 0$

$j = M-1 \text{ to } 0$

$dp[i][j]$

$$= \min(dp[i+1][j], \\ dp[i][j+1]) + \text{cost}[i][j];$$

dp[0]	0	1	2	3	4
0	29	28	30	26	29
1	24	26	22	5	22
2	24	21	29	21	19
3	26	20	20	13	13
4	21	20	18	14	5

* Here every box indicates minimum cost

$dp[0][0]$ contains the res.

from that box to destination.

Reverse Engineering (To print paths with min cost)

For any cell check which or/and has equal value to $dp[i][j]$	0	29	28	30	26	29
	1	24	26	22	5	22
	2	24	21	29	21	19
	3	26	20	20	13	13
	4	21	20	18	14	5

- costs $[i][j]$ at this position.

$dp[i+1][j]$ & $dp[i][j+1]$ both are equal to $dp[i][j]$ - cost so both are added to queue as potential paths.

→ we will use queue and apply BFS technique for reverse engineering

Algo [remove mark* work add children]

↳ based on above

q1

0,0	20	20	21	3,1	3,2	4,1	4,3
29	24	24	21	VVH	VVHV	VVHV	VVHVH

In this way path will be build paths are.

→ VVHVHVHH
→ VVHVHVHH

We used queue because of call stack size

Q. GOLD MINE Problem.

What?

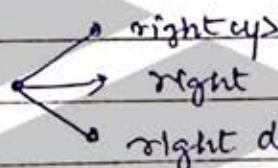

Given a $n \times m$ matrix which contains some positive integer that represents amount of gold. Find out the maximum amount of gold he can collect when 3 moves allowed right up, right, right down

How?

Given matrix:

	0	1	2	3
0	4	1	0	3
1	3	6	2	8
2	6	4	1	6
3	2	0	8	7
4	1	6	3	4

Possible directions

	0	1	2	3
1	0	15	11	8
2	2	17	10, 10	8
3	20	14	9	6
4	18	10	9	7
	17	16	10	4

last column
as it is

$$j = M-1 \text{ to } 0$$

for $i = 0 \text{ to } N-1$

$$\text{dp}[i][j] = \max(\text{dp}[i+1][j], \text{dp}[i-1][j+1], \text{dp}[i][j+1]) + \text{gold}[i][j]$$

res = max of first column.

why?

As he needs to collect maximum gold it will take maximum^{from} possible position.

* Every box represents max gold that can be collected from that box + further

Reverse Engineering To print path

	0	1	2	3	
0	15	11	8	3	Path = R R U R
1	17	11	10	8	
2	20	→ 14	9	6	
3	18	10	9	7	
4	17	16	10	4	

→ For this box make call to positions where $dpl[i][j] = gold[i][j]$

Keyboard Questions.

Q. 2 Keys Keyboard.
What?

You are allowed 2 operations on a keyboard:

- 1) Copy all that copies entire workspace - C
- 2) Paste copied characters - P

* Initially only one character X is present on the workspace.

for a given n , get n X's on workspace & return least number of steps to do it.

Examples: Initially given $n=1$: X.

n	workspace	steps
1	X	0
2	XX	CP (2)
3	XXX	CPP (3)
4	XXXX	CPCP (4)
5	XXXXX	CPPPP (5)
6	XXXXXX	CPCPP / CPPCP gives XXXXXX in (5).

How?

We use sieve of eratosthenes for this question. Initially sieve integer array of 0 to $n+1$ is made where initially each box stores itself as its smallest prime factor.

Then we use sieve method to cancel all non-prime numbers and if any value has been cancelled once, i.e., if at a time $\text{sieve}[i] \neq i$, then no further cancellations are done for ith position.

For ex: $n = 10$

①
loop from here

table look
for ②
starts here

0 - 0
1 - 1
2 - 2
3 - 3
4 - 4/2

5 - 5
6 - 6/2
7 - 7/1
8 - 8/2
9 - 9/3

10 - 10/2

∴ Answer \Rightarrow Now calculate steps:

while ($n \neq 1$)
count += scire[n]
 $n = n / \text{scire}[n]$
return count

$n = 10$	count
10	0
5	2 (10/2)
1	7 (5/5)

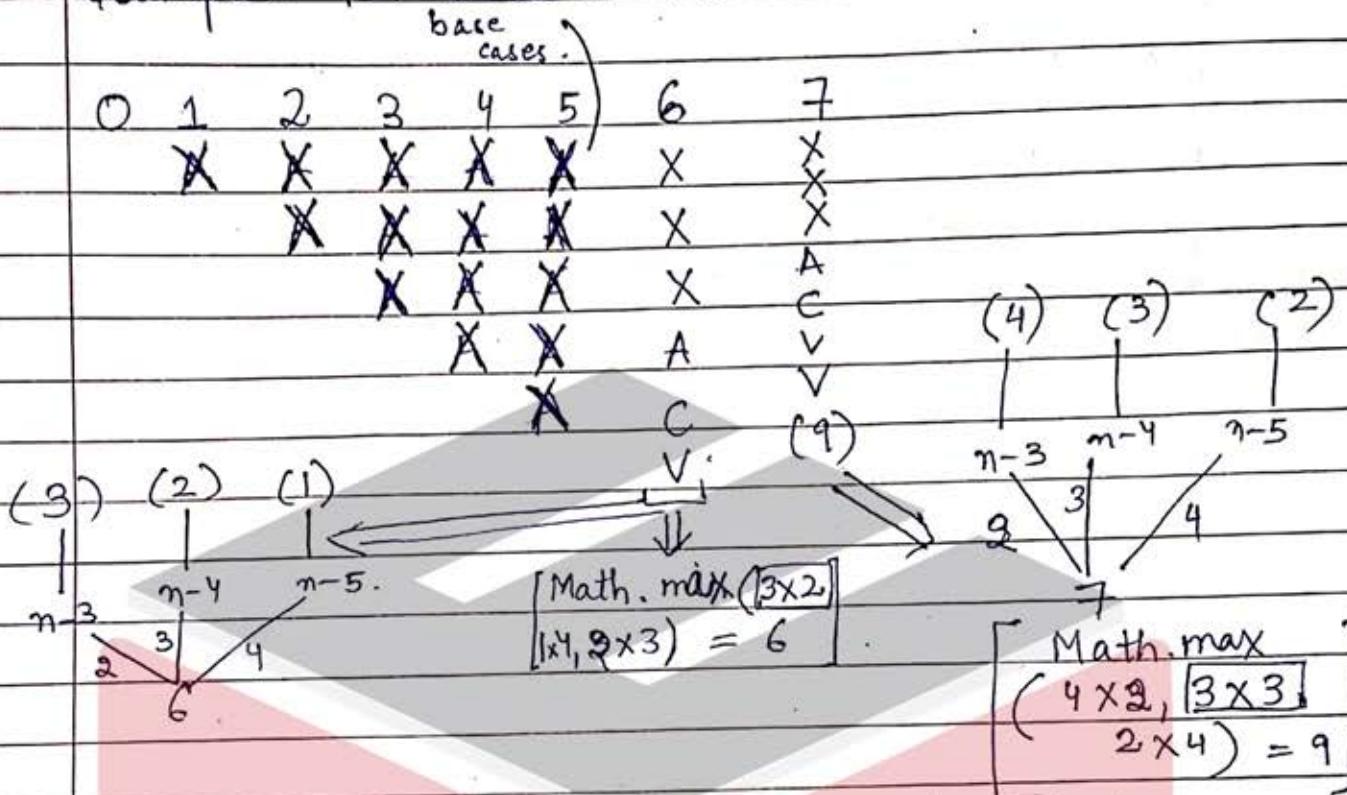

Ans for 10 = 7 which is CPCPPPPP
XXXXXXXXXXXX

Q. 4 Keys Keyboard
what?

You are allowed 4 keys' functions:

- 1) A : Print one 'A' on workspace - (X)
 - 2) (Ctrl+A) : Select whole workspace - (A)
 - 3) (Ctrl+C) : Copy selection to buffer - (C)
 - 4) (Ctrl+V) : Add buffer to workspace - (V)
- Return the max characters you can produce in given n .

Example: For ~~n=6~~ $n=7$:

$\therefore n=7$ can use XXXACVV to produce 9 characters at max.

For each block where $i \geq 6$, $dp[i]$
 $= \text{Math. max} (2 * dp[i-3], 3 * dp[i-4], 4 * dp[i-5])$.

For $i \geq 6$, we look at $i-3, i-4, i-5$ only because all other solutions will be included in these 3 calls.

This is just like fibonacci where ans at i is calculated by $i-1, i-2$ because all other calls are included in these two.

Minimum Jumps and related questions.

Q. Find minimum jumps.

What?

Find minimum jumps required to go from source to destination n , given the jumps that can be made from each place.

How?

Least out of all subsequent path jumps.

$$\underline{n = 10}$$

are	3	5	0	1	2	0	3	1	0	1	0
	0	1	2	3	4	5	6	7	8	9	10

Jumps: dp array of $[n+1]$ size.

dp:	4	3	11	4	3	11	2	12	11	1	0
	0	1	2	3	4	5	6	7	8	9	10

Minimum 4 jumps needed.

store ass.length
at place where
no jumps can be made.

for paths: (Extension)

dp:	4	3	0	1	1	0	1	1	0	0	1	1
	0	1	2	3	4	5	6	7	8	9	10	

4 paths.

* You can also print paths using reverse engineering.

for paths, $dp[n] = 1$, but for jumps,
 $dp[n] = 0$ as 10 to 10 is a path, not
a jump.

* for printing all paths with minimum jumps:

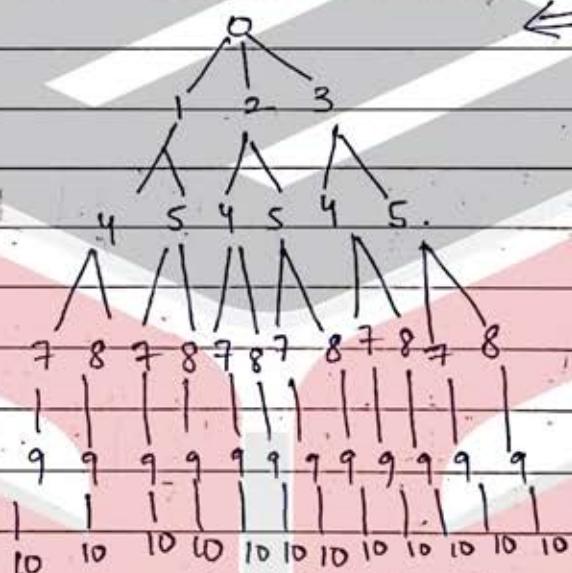

given:

3	5	3	2	4	3	0	2	1	1	10
0	1	2	3	4	5	6	7	8	9	10

dp:

5	4	4	4	3	3	11	2	2	1	0
0	1	2	3	4	5	6	7	8	9	10

← (Index calls)

Q: Minimum steps to minimize n as per given condition.

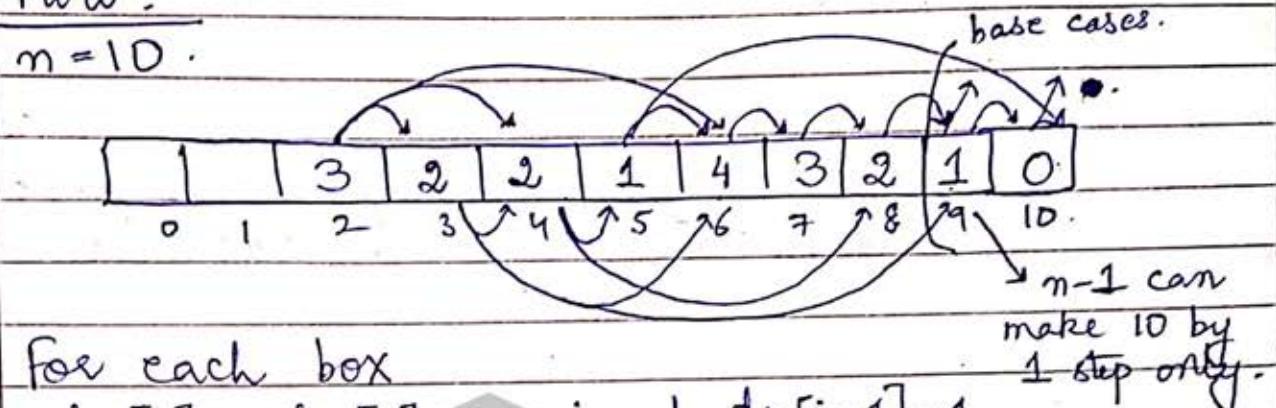

What?

Return minimum steps to convert $n \rightarrow 1$ such that you can:

- 1) Divide n by 2.
- 2) Divide n by 3
- 3) Decrement n by 1.

How?

$n = 10$

for each box

$$dp[i], dp[i] = \min \text{ of } dp[i+1] + 1,$$

$$dp[2^*i] + 1 \quad || \text{ if } 2^*i \leq n$$

$$dp[3^*i] + 1 \quad || \text{ if } 3^*i \leq n$$

Q. Minimum Operations.

What?

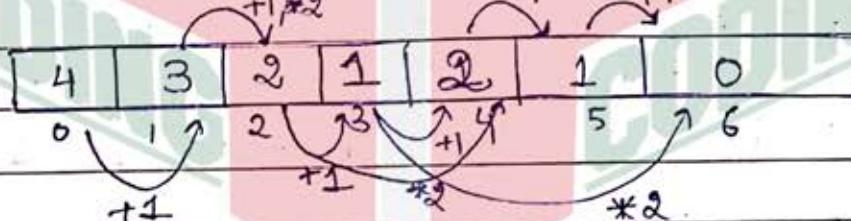

Tell minimum operations to convert $N \rightarrow 0$ given:

1) Double number

2) Add one to number.

How? ex: $n = 6$

Same as previous question.

$\therefore 4$ operations needed.

$$0 + 1 + 1 + 1 * 2$$

1 2 3 4

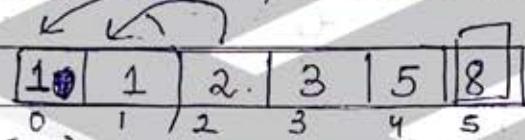

Q. Climb stairs
what?

Given n that is no. of stairs and that you are allowed to take only two steps or one step at a time, count ways to reach the n th stair.

How?

ex: $n = 5$.

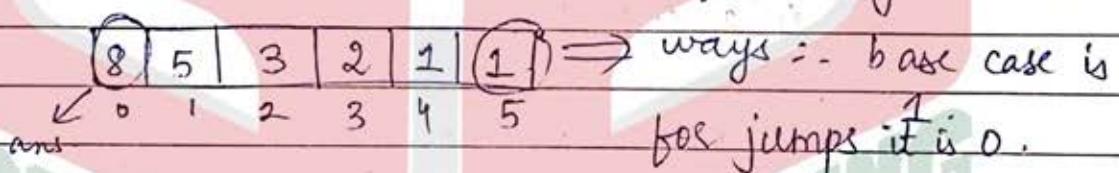

For each stair, make 2 jumps at $n-1$ & $n-2$.

$$dp[i] = dp[i-1] + dp[i-2]$$

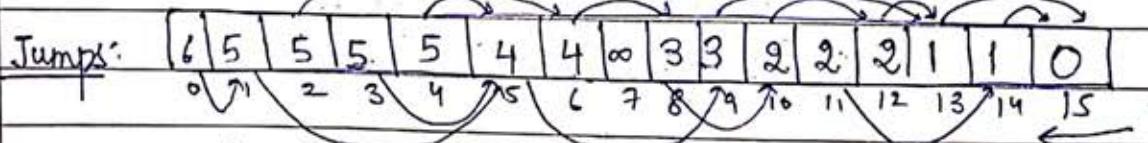

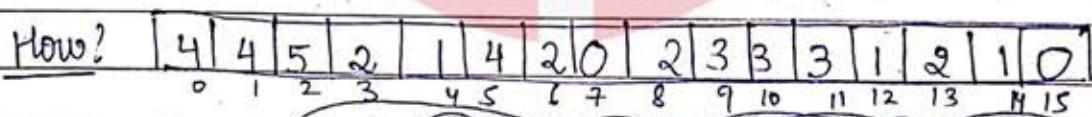

base cases:

You can also build it from right to left.

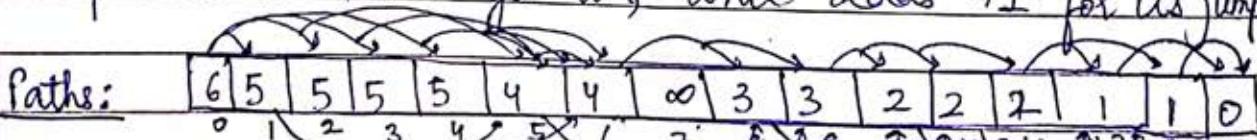

ways :- base case is 1
for jumps it is 0.

Q. # Variation: You are given an array where you are given the number of steps you can take from each box. Return number of jumps & paths?

every ith box chooses min value out of all places it can go to, and adds +1 for its jump.

reverse engineering

Egg Drop

Q what?

You are given number of floors and number of eggs in which you need to tell which floors are safe to drop egg from, and those which are not.

Return minimum number of ~~eggs~~ trials required to tell the critical floor, the one after which egg breaks.

How?

ex: floors = 10, eggs = 2

											floors
0	1	2	3	4	5	6	7	8	9	10	
0	0	0	0	0	0	0	0	0	0	0	
1	0	1	2	3	4	5	6	7	8	9	10
2	0	1	2	2	3	3	3	4	4	4	4
3	0	1	2	2	3	3	3	4	4	4	4
4	0	1	2	2	3	3	3	4	4	4	4
5	0	1	2	2	3	3	3	4	4	4	4
6	0	1	2	2	3	3	3	4	4	4	4
7	0	1	2	2	3	3	3	4	4	4	4
8	0	1	2	2	3	3	3	4	4	4	4
9	0	1	2	2	3	3	3	4	4	4	4
10	0	1	2	2	3	3	3	4	4	4	4

ex: $dp[2][7] = 1 + \min(dp[1][6], dp[2][6])$

\min

$\max(dp[1][0], dp[2][6])$

$\max(dp[1][1], dp[2][5])$

$\max(dp[1][2], dp[2][4])$

$\max(dp[1][3], dp[2][3])$

$\max(dp[1][4], dp[2][2])$

$\max(dp[1][5], dp[2][1])$

$\max(dp[1][6], dp[2][0])$

$$\min(3, 3, 3, 3, 4, 5, \infty) \\ = 3 + 1 = 4$$

else

$$l = 0, r = j - 1$$

min = INT-MAX

while ($l < j$)

$$\min = \min(\min, \max(dp[i-1][l], \\ dp[i][r]))$$

$l++$

$r--$

$$dp[i][j] = \min + 1$$

At a given floor, we compute its dp keeping in mind worst luck, i.e. maximum of egg break and save probabilities from all floors prior to current floor.

$$\min \left[\max\left(\frac{m_{s0}}{m_{b,j-1}}\right), \max\left(\frac{m_{s1}}{m_{b,j-2}}\right), \dots, \max\left(\frac{m_{sj-1}}{m_{b0}}\right) \right]$$

$\left(\frac{f}{e} \right)_{at j}$

Q. Optimal strategy for a game what?

Consider row of n coins with even n . We play a game against an opponent who is equally intelligent by keeping alternating turns. In each turn, a player either selects first or last coin and add its score into his score. He then removes it. Remove maximum amount of money you can definitely win if we move first.

How?

ex: {1, 4, 8, 15, 3, 7, 22, 11}

Using greedy approach for this question:

→ We consider odd sum and even sum for this strategy. At each level, if $oddsum > even sum$, choose an odd element (index wise), else choose even indexed element.

→ If at a given time either only odds or only evens are visible, choose maximum of them.

// This approach fails in the above testcase.

Use DP approach

* Move in gap strategy.

* For each dp box, $dp[i][j] = \max(v1, v2)$
 where $v1 = \min(dp[i+2][j], dp[i+1][j-1]) + a[i]$
 and $v2 = \min(dp[i][j-2], dp[i+1][j-1]) + a[j]$

here, $dp[i+2][j]$ considering P1 & P2 both
 choose 2 front elements.

$dp[i+1][j-1]$ considering One of them
 chose first one and other
 chose last one.

$dp[i][j-2]$ considering both P1 & P2 chose
 elements from last.

	0	1	2	3	4	5	6	7	ans
0	1	4	9	19	12	26	34	37	
1	0	4	8	19	19	18	41	37	
2	0	0	8	15	11	22	33	33	
3	0	0	0	15	15	18	29	33	
4	0	0	0	0	3	7	25	25	
5	0	0	0	0	0	7	22	18	
6	0	0	0	0	0	0	22	22	
7	0	0	0	0	0	0	0	11	

Q. Encodings
what?

You will be given a number where encodings can be done as $1 \rightarrow A, 2 \rightarrow B, \dots, 10 \rightarrow J, 11 \rightarrow K, \dots, 26 \rightarrow Z$. Other than this, all numbers are invalid. Return maximum strings you can form after encoding the number, return all lowercase strings.

ex. 1 2 4 3 10 2 1

How? Consider multiple cases:

1) $x \underline{12} y$.

2 can be used as 2, 12.

2) $x \underline{32} y$.

2 can only be used as 2, 32 is invalid.

3) $x \underline{02} y$.

2 can only be used as 02 else 0 would make string invalid.

4) $x \underline{20} y$.

0 can only be used as 20, else 0 alone is invalid.

5) $x \underline{30} y$.

0 makes it invalid as neither 30, nor 0 are valid.

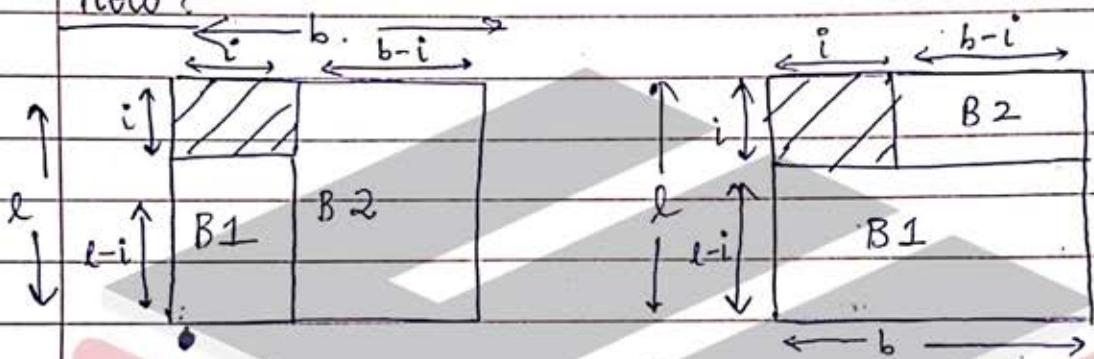

all →	1	2	4	3	1	0	2	1	answer
dp →	1	2	3	3	3	3	3	1	
a b	ab	ax	axc	axca	axcj	axcj	axcj	axcjba	
&	abd	abd	abdc	abdca	abdcj	abdcj	abdcj	abdcjba

&								axcjba	
&								abdcjba	
&								ldcjba	
&								axcj	
&								abdcj	
&								ldcj	

Q. Minimum Number of Squares.

What?

Given a paper of size $A \times B$, return minimum number of squares that can be cut from paper.

How?

ex: $L = 4, B = 5$.

	0	0	0	0	0	0
0	0	0	2	3	4	5
1	0	2	0	3	2	4
2	0	3	3	0	4	4
3	0	4	2	4	0	5
4	0	4	2	4	0	5

$\xrightarrow{\text{Memoized}}$

ans.

For calculating, we use memoization and gather 2 results: $fn \rightarrow$ recursive function.

$$lc = 1 + fn(l-i, i) + fn(l, b-i)$$

$$rc = 1 + fn(l-i, b) + fn(i, b-i).$$

$$\text{your ans} = \min(lc, rc).$$

$$// dp[l][b] = ans.$$

return ans;

Other DP questions

Q. Temple Offerings.

What?

You are given an array of heights of various temples, you need to return the minimum number of garlands you'll need such that a temple whose height is more than its 2 adjacent temples is offered more garlands than them.

*minimum 1 to each temple.

How?

$$\text{ex: arr} = \{1, 4, \frac{3}{2}, \frac{6}{3}, \frac{2}{4}, \frac{1}{5}\}$$

left \rightarrow	1	2	1	2	1	1
i=0 to n-1	1	2	3	4	5	

*Keep arr[0] = 1.

If $\text{arr}[i] < \text{arr}[i+1]$

$\text{arr}[i] = 1$ // or maintain count or $\text{arr}[i+1] = 1 + \text{arr}[i]$.

// and then $i+1$ gets more than i .

*Keep arr[n-1] = 1.

1	2	1	3	2	1	← right
0	1	2	3	4	5	

$$\text{ans} \leftarrow \max(\text{left}[i], \text{right}[i]);$$

ans \Rightarrow	1	2	1	3	2	1	\times
	0	1	2	3	4	5	

EDIT DISTANCE

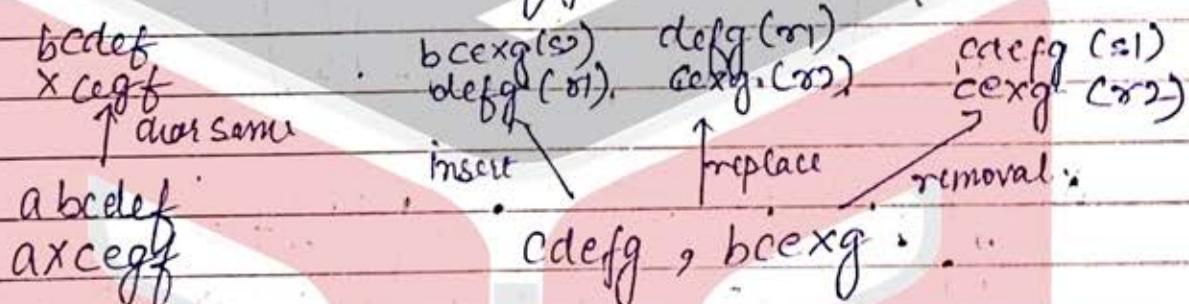

What?

Count minimum operations needed to be done on string 2 to make it same as string 1.
operations are insert (ie insert a character), delete (delete a char), replace (change value of char)

How?

e.g. $s_1 = a b c d e f$

$s_2 = a x c e g f$

	a	x	c	e	g	f	-
a	3	4	4	5	5	15	6
b	4	3	3	4	4	4	5
c	4	3	2	3	3	3	4
d	4	3	2	2	2	2	3
e	4	3	2	1	1	1	2
f	5	4	3	2	1	0	1
-	6	5	4	3	2	1	0

→ replace remove
→ replace replace
→ insert
→ Addition
(s_2 blank but s_1 has characters)

removals
(s_1 blank but s_2 has characters)

$$c_1 = c_2 \Rightarrow dp[s_1][r_2] \Rightarrow dp[r_1][g_1]$$

$$c_1 \neq c_2 = \begin{cases} 1 + dp[i+1][j] & \text{(insert)} \\ 1 + dp[i+1][j+1] & \text{(replace)} \\ 1 + dp[i][j+1] & \text{(remove)} \end{cases}$$

Maximum 1's Square

What?

Given a 2-D matrix of 0's and 1's find the maximum area square in this matrix

How?

	0	1	2	3	4	5	6	7
eg: 0	1	0	1	0	1	1	1	0
1	0	1	1	1	1	0	1	1
2	0	1	1	0	0	2	1	2
3	2	1	2	2	2	2	1	2
4	0	2	2	2	2	0	1	2

DP:	0	1	2	3	4	5	6	7
0	1	0	1	0	2	2	1	0
1	0	3	2	1	1	3	2	1
2	0	3	2	1	0	2	2	1
3	1	2	2	2	1	1	2	1
4	0	1	1	1	1	0	1	1

when zero
So zero
as it is.

$$dp[i][j] = \min(dp[i+1][j], dp[i][j+1], dp[i+1][j+1]) + 1$$

* Every box contains length of square starting from this point

Related question

Q. Find maximum area rectangle of all 1's of a given matrix

→ Solve using maximum area histogram → stacks.

Q Mobile Numeric Keypad

What?

You are given a numeric keypad and N length find the numbers possible that can be made such that you can only press up, left, down, right to the current button or button itself.

How?

Make an 2×3 array to store what keys to press from current key.

2	1	2	3
4		5	6
7		8	9
*	0	#	

keypad.

$0 \rightarrow 0, 8$, $1 \rightarrow 2, 4, 1$, $2 \rightarrow 1, 2, 3, 5$, $3 \rightarrow 2, 3, 6$
 $4 \rightarrow 1, 4, 5, 7$, $5 \rightarrow 2, 4, 5, 6, 8$, $6 \rightarrow 3, 5, 6, 9$
 $7 \rightarrow 4, 7, 8$, $8 \rightarrow 5, 7, 8, 9, 0$, $9 \rightarrow 6, 8, 9$.

eg: $N=3$

0	1	2	3	4	5	6	7	8	9
0	1	2	2	1	2	1	1	1	1
1	2	3	4	3	4	5	4	3	5
2	7	11	15	11	15	22	15	12	18

summation:

$$\text{Ans} = 138$$

All possible keys that can be pressed.

$$\begin{aligned}
 & dp[2] + dp[3] + dp[6] \quad (\text{Previous row}) \\
 & = 4 + 3 + 4 = 11
 \end{aligned}$$

Rod Cutting

What?

Find the maximum cost that can be obtained by cutting a rod such that each length piece has its own selling price.

How?

eg: len = 8

1	2	3	4	5	6	7
3	5	6	15	10	25	12
9	2	3	4	5	8	7

Each piece of length can be cut in pieces of 1 to l lengths.

$$dp[i] = \max (dp[j] + \text{cost}[j-1])$$

Because of 0 indexing

dp:

0	3	6	9	15	18	25	28	31
0	1	2	3	4	5	6	7	8

Ans = 31

at 4 → $\xrightarrow{\text{length of pieces cut.}} 4-1 = 3$ cur cost = $dp[3] + \text{cost}[2]$
 $= 9 + 6 = 15$

→ $4-2 = 2 \Rightarrow dp[2] + \text{cost}[1] = 6 + 5 = 11$

→ $4-3 = 1 \quad dp[1] + \text{cost}[0] = 3 + 3 = 6$

→ $4-4 = 0 \quad dp[0] + \text{cost}[3] = \cancel{15}$
 ↴ whole piece
 no cut

Caps

what?

Given n persons and K caps so count the total number of arrangement D ways such that none of them are wearing the same type of cap.

how?

→ A dp of 2-dimension of size $K \times 2^n$ is made where 2^n columns stores the count for that particular bitmask.

eg: Person Caps

- $0 \rightarrow 1, 3$
- $1 \rightarrow 2, 2, 3$
- $2 \rightarrow 0, 2$

Caps Map

- cap → person
- $0 \rightarrow 2$ (which can be worn by which person)
- $1 \rightarrow 0, 1$
- $2 \rightarrow 1, 2$

Ans = 6	(3 people possible bitmask)								2
	0	1	2	3	4	5	6	7	
caps	0	(6)	5	2	2	4	3	2	2
	1	2	2	2	1	4	3	2	1
	2	0	1	1	1	1	2	1	1
	3	0	0	0	0	0	1	1	1
(No cap)	4	0	0	0	0	0	0	0	0
	0000	001	010	011	100	101	110	111	person 1, person 2, person 3

For each position check if that person can wear current cap or not by checking the caps map.

for cap 2 (row with index 2) (≤ 2 person can wear it)

- index 7 (111) \rightarrow since both 1st & 2nd bit set so next row value
- idx 6 (110) \rightarrow next row value as it, (nobody wore this cap)
- idx 5 (101) \rightarrow $dp[i][j] = dp[\cancel{i+1}] \underline{\underline{j}}[7] + dp[3][\cancel{10} \rightarrow 11]$
- idx 4 (100) $\rightarrow dp[3][6] + dp[3][4] = 1$
- idx 3 (011) $\rightarrow dp[3][7] + dp[3][3] = 1$
- idx 2 (010) $\rightarrow dp[3][6] + dp[3][2] = 1$
- idx 1 (001) $\rightarrow dp[3][5] + dp[3][1] + dp[3][3] = 1$
- idx 0 (0 00) $\rightarrow dp[3][4] + dp[3][2] + dp[3][0] = 0$

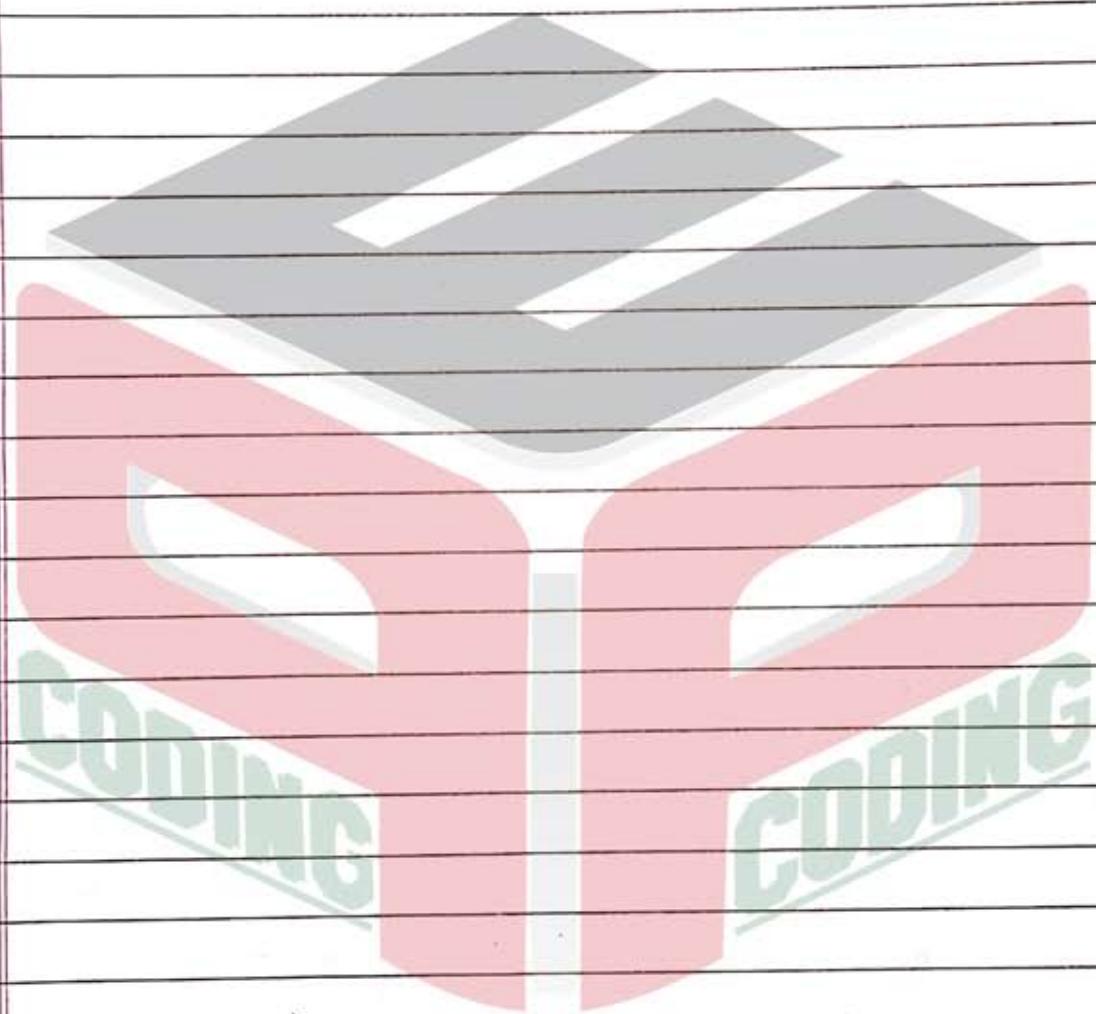

We are using bitmask here to save space.
And through bitmask we can store possible arrangements (2^{32}) for 32 person.

This is recursion with caps on level. Where each cap has choice To be worn or not.

Q

Probability that Knight remain on chessboard.

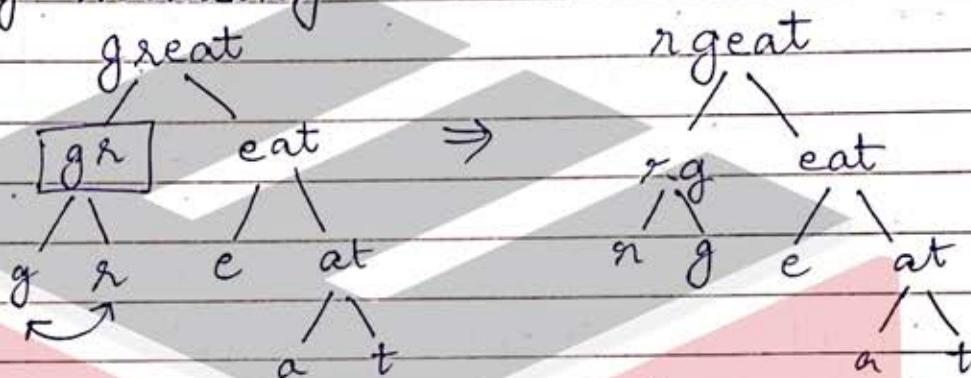

3D DP Questions

Q. Scramble Strings

what?

Given a string s_1 , we may represent it as a binary tree by partitioning it to two non-empty substrings recursively.

ex:

To scramble a string, we may choose node "gr" and swap its two children, only nonleaf nodes can be chosen for swapping its children.

Many scramble strings of a word, are possible; now you are given two strings s_1 and s_2 , determine if s_2 is a scrambled string of s_1 .

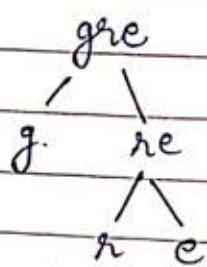

How?

This question is based on using a 3D-dp. Before proceeding to form a dp, we check that if lengths of two strings are not same, then s_2 can never be a scramble of s_1 .

Consider a simple case "gee".

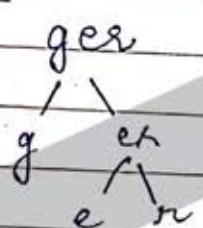

The splits can be done as "g" and "ee" or "gr" and "e". So a scrambled string of "gee" can be "ger", "rge", "egr", "reg", "erg" or itself "gee".

gre:

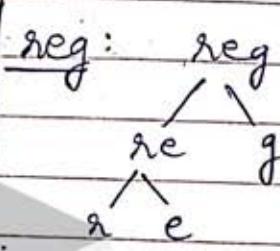

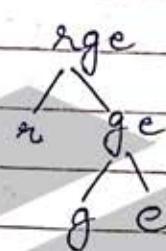

scrambles:

ger:

rge:

and so on..

In DP, 3 dimensions i, j, k signify i as the index of string 1, j as the index of string 2 and k as the length of the substring being considered.

At $k=1$, dp looks like:

g	x	x	x	x	✓
r	✗	x	x	✓	✗
e	✓	x	x	x	y
a	✗	✓	x	x	x
t	✗	x	✓	x	x
	e	a	t	r	g

Let $dp[i][j][k]$ be whether the substring in $s_1[i \dots i+k-1]$ is a scramble of $s_2[j \dots j+k-1]$ or not.

Since each of these substrings is a potential node in the tree, we need to check for

all possible cuts.

For all cuts q where $q < k$, we have following:

$s_1[i \dots i+q] \quad | \quad s_2[j \dots j+q-1] \quad | \quad s_1[i+q \dots i+k-1]$

which means two possibilities:

$$s2 \left[\begin{array}{cccc} y_1 & 1 & y_2 & j+k-1 \\ j & j+q & & \end{array} \right]$$

or

$$s2 \left[\begin{array}{ccc} y_1 & 1 & y_2 \\ j & j+k-q & j+k-1 \end{array} \right]$$

where calls are :

$dp(i, j, k) =$ for $k=1,$

{ $s1.\text{charAt}(i) == s2.\text{charAt}(j)$ }

else \rightarrow for $1 \leq q \leq k,$

{ $((dp[i][j][q] \& dp[i+q][j+q][k-q])$

||

$(dp[i][j+k-q][q] \& dp[i+q][j][k-q]))$

}

for 2 words $s1 = "great", s2 = "eateg", dp$ is :-

	0	1	2	3	4
0	X	X	X	X	✓
1	X	X	X	✓	X
2	✓	X	X	X	X
3	X	✓	X	X	X
4	X	X	✓	X	X

$k=1$

	0	1	2	3	4
0	X	X	X	✓	X
1	X	X	X	X	X
2	✓	X	X	X	X
3	X	✓	X	X	X
4	X	X	X	X	X

$k=2$

	0	1	2	3	4
0	X	X	X	X	X
1	X	X	X	X	X
2	✓	X	X	X	X
3	X	✓	X	X	X
4	X	X	X	X	X

$k=3$

	0	1	2	3	4
0	X	X	X	X	X
1	✓	X	X	X	X
2	X	X	X	X	X
3	X	X	X	X	X
4	X	X	X	X	X

$k=4$

answer

	0	1	2	3	4
0	✓	X	X	X	X
1	X	X	X	X	X
2	X	X	X	X	X
3	X	X	X	X	X
4	X	X	X	X	X

$R=5$

Q. Cherry Pickup what?

In an $N \times N$ grid representing field of cherries, each cell have 3 possibilities, $0 \rightarrow$ empty cell, $1 \rightarrow$ cell has a cherry, $-1 \rightarrow$ obstacle. You can pass through 0 and 1 valued cells. Your task is to collect maximum number of cherries possible by following rules:

- a) You can move right / down till $(N-1, N-1)$ cell from $(0, 0)$.
- b) When you pass through a cherry (1) box, you pick it up and it becomes 0 .
- c) If there is no valid path between $(0, 0)$ to $(N-1, N-1)$, then no cherries can be collected.
- d) You can move back to $(0, 0)$ once you reach $(N-1, N-1)$ by moving up or left.

How?

Instead of moving from $(0, 0)$ to $(N-1, N-1)$ and then back to $(0, 0)$, we assume we have 2 people moving from $(0, 0)$ to $(N-1, N-1)$. This is because we need 2 max paths that give max cherries, and hence direction does not matter.

We will do this question by using a 3D memoization dp, where for both people, we have 4 possible cases:

- a) DD : n_1+1, c_1, n_2+1
- b) RR : n_1, c_1+1, n_2
- c) DR : n_1+1, c_1, n_2
- d) RD : n_1, c_1+1, n_2+1

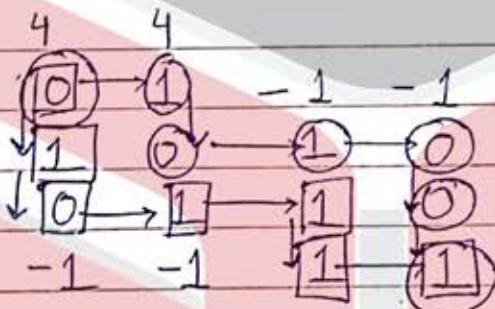

We use only 3 parameters as c_2 can be calculated as $c_2 = r_1 + c_1 - r_2$.

→ Initialize $dp[r][c][r]$ with Integer.MIN_VALUE.
For each (r_1, c_1, r_2) , we fill dp as:

$$dp[r_1][c_1][r_2] = \text{grid}[r_1][c_1] + ((c_1 == c_2) ? \text{grid}[r_2][c_2] : 0);$$

// add $\text{grid}[r_2][c_2]$ only when $c_1 \neq c_2$.
Make 4 calls of DD, RR, RD, DR as mentioned
and add max of these values into
 $dp[r_1][c_1][r_2]$.

ex:

Boxes show path by person 1, circles show path by person 2.

Person 1: $0 \rightarrow 1 \rightarrow 0 \rightarrow 1 \rightarrow 1 \rightarrow 1 \rightarrow 1 = 5$.

Person 2: $0 \rightarrow 1 \rightarrow 0 \rightarrow 1 \rightarrow 0 \rightarrow 0 \rightarrow 1 = 2$.

∴ Total cherries

$$= \underline{\underline{7}} (5+2)$$

this cherry not counted again.

Q Probability that Knight remains on chessboard.

what?

Given a $N \times N$ chessboard and a knight position (x, y) . The knight has to take exactly k steps where at each step it chooses from all 8 directions it can move in. Find the probability that knight remains on the chessboard after k steps? It can't enter board again after leaving.

How?

Make a 3-D DP of size $K+1 \times N \times N$
Where K is steps that knight can take

DP stores the probability of remaining on board when k steps are taken and knight is in i, j th box

eg: $K=3$ $N=4$ $x=0$ $y=0$

				$K=1$								
				0	1	2	3	0	1	2	3	
				0	0.25	0.375	0.375	*				
0	1.0	1.0	1.0	1	0.375	0.5	0.5	*	0.25	0.375	0.375	
1	1.0	1.0	1.0	2	0.375	0.5	0.5	*	0.25	0.375	0.375	
2	1.0	1.0	1.0	3	0.375	0.5	0.5	*	0.25	0.375	0.375	
3	1.0	1.0	1.0	0	0.25	0.375	0.375	*	0.25	0.375	0.375	

$K=0$

(When $K=0$ means 0 steps

so staying in the board

Probability 1.0)

$$\frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8} = \frac{4}{8} = \underline{\underline{0.5}}$$

For this position
possible positions
are marked

These positions in

Prob/8 & previous board ($K-1$)

current prob. will be sum
of all

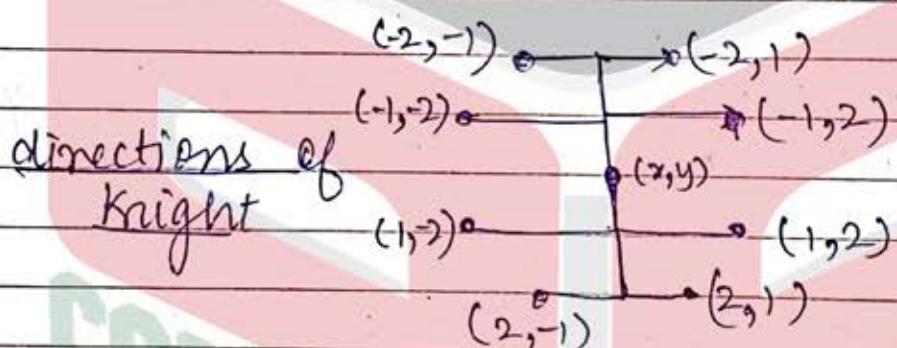

will give probabilities
when $K-1$ step was taken

	0	1	2	Date _____	DELTA Pg No. _____
0	0.125	0.15625	0.15625	0.125	
1	0.15625	0.15625	0.15625	0.15625	K=2
2	0.15625	0.15625	0.15625	0.15625	
3	0.125	0.15625	0.15625	0.125	

	0	1	2	3
0	0.390625	0.05859375	0.05859375	0.0390625
1	0.5859375	0.0703125	0.0703125	0.0585937
2	0.5859375	0.0703125	0.0703125	0.0585937
3	0.390625	0.05858375	0.05859375	0.0390625

K = 3

$$\text{Ans} = \text{dp}[K][x][y] = \text{dp}[3][0][0] \\ = 0.390625 \quad \underline{\text{Ans}}$$

$$\text{new } x = \text{dir}[x][0] + x$$

$$\text{new } y = \text{dir}[y][1] + y$$

\downarrow
steps

Pseudo Code

$k=0$ to $k=K$

$i=0$ to n

$j=0$ to n

if $k=0$ $\text{dp}[k][i][j] = 1.0$,
else

∞ to 8 (directions)

$$nx = \text{dir}[x][0] + i,$$

$$ny = \text{dir}[y][1] + j;$$

if (nx, ny) valid

~~else~~

$$dp[i][j][k] = dp[i-1][j][k] + \frac{dp[i-1][j-1][k]}{8}$$

Ans $dp[i][j][k]$

* we are doing probability sum by 8 because out of 8 possible direction only few steps some directions (possibly all) lie inside board. So they are only included.

Q Longest Common Subsequences of 3

what?

Given 3 strings s_1, s_2, s_3 find the longest common subsequence b/w them.

How?

Same approach as longest Common Subsequence of 2 strings but here for 3 strings.

Make a 3-D DP which 3 strings at its 3 dimensions

dp size is $s_1\text{-length} \times s_2\text{-length} \times s_3\text{-length}$

* when a character is same in all strings s_1, s_2, s_3 it means for string s_1 remaining string r_1

for string s_2 remaining string r_2

for string s_3 remaining string r_3

$$dp[i][j][k] = dp[i][j][k] + 1$$

as a common character found.

In other case when all three character are not equal. 3 cases will cover all cases.

1) $s_1 \leq s_2 \leq s_3$ 2) $s_1 \geq s_2 \geq s_3$ 3) $s_1 \neq s_2 \neq s_3$

\downarrow
string 3
loses 8 characters

\downarrow
string 2
loses a
character

\downarrow
string 1 loses
a character

eg: $s_1 = abcd f$
 $s_2 = aeabd f$
 $s_3 = abdcef . . .$

	a	b	d	c	e	f	-	a	b	d	c	e	f	-
